

# Autoradiography

- Autoradiography is a technique used to visualize the distribution of radioactive materials in a sample, such as biological tissues or gels
- It involves exposing a photographic film or detector to the sample, where radioactive emissions create an image
- This method is valuable for studying cellular and molecular processes by tracking substances like DNA, proteins, or drugs
- Autoradiography is particularly useful in research and medical diagnostics to analyze biochemical pathways and disease mechanisms

## Practical example: Medical imaging

- Autoradiography is a technique used in medical imaging to visualize the distribution of radioactive substances within a tissue sample
- In healthcare, it is particularly useful for studying the spread of cancerous cells or understanding biochemical pathways in diseases
- By applying a radioactive tracer that binds to specific molecules within the body, and then placing the tissue against a photographic film, the emitted radiation exposes the film, creating a detailed image of the tracer's location
- This helps physicians diagnose and tailor treatments more effectively
