

### **Direct Transfer of Technology**

The direct transfer of less sophisticated advances in technology and of new applications of more mature technology offers potential near-term economic benefit for the South. There are important opportunities for influencing global economic development with what we would view today as low technology, as opposed to the high-technology advances that are the primary goals of our research and development (R&D) efforts. The development of ocean transport since World War II illustrates this point.

In the early 1950s it was clear that no significant improvements in ocean transportation had occurred for over 150 years. The world shipping industry was still largely dependent on the 10,000-ton, 10-knot Liberty ship for bulk movements throughout the world. The clipper ships of the early nineteenth century sailed at higher speeds than the so-called modern ships of the 1950s, at least at times; the modern ships offered only greater schedule reliability. Furthermore, the clippers transported almost as much cargo and certainly operated at a fraction of the cost.

During that 150-year period, technological advances in land transportation, including railroads, trucking, and pipelines, conspired to bring about a substantial reduction in the real cost of moving bulk materials overland. This relative change in cost of land transport versus ocean transport influenced industrial development, and hence the economic and political growth patterns of the entire world.

In the mid-1950s companies began to push for the construction of larger ships based on new designs. This produced a complete revolution in ocean transportation throughout the 2 decades that followed. Hull forms were improved, propulsion machinery was advanced, and ship holds were modified to accommodate combination cargos. In the packaged cargo field, containerized shipping developed rapidly. The net result was a substantial reduction in the cost of ocean transportation in real terms during this period. By 1970 the cost of moving bulk material throughout the world was reduced to approximately 25 percent of the cost in 1950. During this same period, land transportation costs increased substantially in real terms. The result was, again, a major change in the pattern of global material movements. This new oceanic era generated a dramatic impact on economic growth and political relations throughout the entire world.

The Japanese, for example, built a steel industry on deep water, to
