Communication Protocol Specification and Verification Richard Lai,Ajin Jirachiefpattana,2012-12-06

Communication protocols are rules whereby meaningful communication can be exchanged between different communicating entities In general they are complex and difficult to design and implement Specifications of communication protocols written in a natural language e g English can be unclear or ambiguous and may be subject to different interpretations As a result independent implementations of the same protocol may be incompatible In addition the complexity of protocols make them very hard to analyze in an informal way There is therefore a need for precise and unambiguous specification using some formal languages Many protocol implementations used in the field have almost suffered from failures such as deadlocks When the conditions in which the protocols work correctly have been changed there has been no general method available for determining how they will work under the new conditions It is necessary for protocol designers to have techniques and tools to detect errors in the early phase of design because the later in the process that a fault is discovered the greater the cost of rectifying it Protocol verification is a process of checking whether the interactions of protocol entities according to the protocol specification do indeed satisfy certain properties or conditions which may be either general e g absence of deadlock or specific to the particular protocol system directly derived from the specification In the 80s an ISO International Organization for Standardization working group began a programme of work to develop formal languages which were suitable for Open Systems Interconnection OSI This group called such languages Formal Description Techniques FDTs Some of the objectives of ISO in developing FDTs were enabling unambiguous clear and precise descriptions of OSI protocol standards to be written and allowing such specifications to be verified for correctness There are two FDTs standardized by ISO LOTOS and Estelle Communication Protocol Specification and Verification is written to address the two issues discussed above the needs to specify a protocol using an FDT and to verify its correctness in order to uncover specification errors in the early stage of a protocol development process The readership primarily consists of advanced undergraduate students postgraduate students communication software developers telecommunication engineers EDP managers researchers and software engineers It is intended as an advanced undergraduate or postgraduate textbook and a reference for communication protocol professionals

standards are comprised of two components The protocol and Signal data port specifications for the devices involved The protocol describes the format of the message and the meaning of each part of the message To connect any device to the bus an external device must be used as an interface which will put the message in a form which fulfills all the electrical specifications of the port These specifications are called the Standard The most famous such serial communication standard is the RS 232 In IT technology Communication can be serial or parallel Serial communication is used for transmitting data over long distances It is much cheaper to run the single core cable needed for serial communication over a long distance than the multicore cables that would be needed for parallel communication It is the same in wireless communication Serial communication needs one channel while parallel needs multichannel Serial Communication can also be classified in many other ways for example synchronous and asynchronous it can also be classified as simplex duplex and half duplex Because of the wide spread of serial communication from home automation to sensor and controller networks there is a need for a very large number of serial communication standards and protocols These have been developed over recent decades and range from the simple to the highly complicated This large number of protocols was necessary to guarantee the optimum performance for the targeted applications It is important for communication engineers to have enough knowledge to match the right protocol and standard with the right application The main aim of this book is to provide the reader with that knowledge The book also provides the reader with detailed information about Serial Communication Universal Asynchronous Receiver Transmitter UART Universal Synchronous Asynchronous Receiver Transmitter USART Serial Peripheral Interface SPI eSPI Universal Serial Bus USB Wi Fi WiMax Insteon The details of each technology including specification operation security related matters and many other topics are covered The book allocates three chapters to the main communication standards These chapters cover everything related to the most famous standard RS 232 and all its variants Other protocols such as I2C CAN ZigBee Z Wave Bluetooth and others are the subject of the authors separate book Microcontroller and Smart Home Networks
