

## Intentional Ignorance: A Case Study of a Professional

**Abstract** This paper examines intentional ignorance in a professional context. It begins by defining intentional ignorance as the deliberate failure to acquire or use available information. It then discusses the ethical implications of intentional ignorance, particularly in the context of professional responsibility. The paper uses a case study of a professional to illustrate how intentional ignorance can be used to avoid ethical obligations. It argues that intentional ignorance is a form of self-deception that allows professionals to avoid the consequences of their actions. The paper concludes by discussing the importance of transparency and accountability in professional practice.

**Instrumentation for Ground-Based Optical Astronomy** Lloyd B. Robinson, 2012-12-06 Historically the discovery of tools or evidence that tools have been used has been taken as proof of human activity certainly the invention and spread of new tools has been a critical marker of human progress and has increased our ability to observe measure and understand the physical world In astronomy the tools are telescopes and the optical and electronic instruments that support them The use of the telescope by Galileo marked the beginning of a new and productive way to study and understand the universe in which we live The effects of this new tool on what we can see and how we see ourselves are well known However after almost four centuries of developing ever more sensitive and subtle instruments as tools for astronomy it might have been expected that only a few minor improvements would remain to be made or that possibly the law of diminishing returns would have taken effect On the contrary the new instruments and ideas for new instruments described in this book make it clear that the rate of progress has not diminished and that this subject is still as exciting and productive as ever Instrumentation for Ground Based Optical Astronomy was chosen as the theme for the Ninth Santa Cruz Summer Workshop in Astronomy and Astrophysics

High Resolution Infrared Spectroscopy in Astronomy Hans Ulrich Käufl, R. Siebenmorgen, Alan F.M. Moorwood, 2005-07-18 Two specialized new instruments for ESO's VLT VISIR and CRRES spawned the idea for this workshop CRRES is a dedicated very high resolution infrared spectrograph VISIR features a high resolution spectroscopic mode Together the instruments combine the sensitivity of an 8m telescope with the now well established reliability of VLT facility instruments High resolution here means that lines in cool stellar atmospheres and HII regions can be resolved The astrophysical topics discussed in this rather specialized workshop range from the inner solar system to active galactic nuclei There are many possibilities for new discoveries with these instruments but the unique capability which becomes available through high resolution infrared spectroscopy is the observation of molecular rotational vibrational transitions in many astrophysical environments Particularly interesting and surprising in this context many papers on modeling and laboratory spectroscopy at the workshop appear to indicate that astronomical observations are lagging a bit behind in this field The papers are an interesting mix of reports from existing high resolution facilities reports on modeling efforts of synthetic spectra and reports on laboratory spectra In this sense a fruitful exchange between molecular physics and astronomy was again accomplished and is documented in this volume
