The Bunker Climate Atlas Of The North Atlantic Ocean Observations Environmental Toxin Series:

The Bunker Climate Atlas of the North Atlantic Ocean H.-J. Isemer, L. Hasse, 2012-12-06 Marine Meteorology has a long tradition and studies of surface meteorological conditions have been published repeatedly since the end of the last century. Recently the demand has grown for more detailed descriptions. This stems both from the public's interest in climatic change and from our growing ability to analyse atmospheric and oceanic processes with the aid of numerical models. These models require input data on a regular finely spaced grid; the increased amount of oceanic data available permits us to provide detailed charts both of surface meteorological conditions and of the air-sea interaction. The present climate atlas of the North Atlantic Ocean is based on data originally evaluated by Andrew F. Bunker of Woods Hole Oceanographic Institution. He analysed observations from the ships of the Voluntary Observing Fleet in many parts of the world's oceans to calculate the various components of the heat budget at the air-sea interface. When Bunker died in 1979 he left the major part of his data and results in an unpublished state. Since he had expended considerable effort to validate the data and calculate air-sea fluxes by the so-called individual method, it was considered worthwhile to make this unique set of climate data available to the scientific community. Bunker's analysed fields for the North Atlantic Ocean are presented in this atlas. It deals with the surface climate of the North Atlantic Ocean from the equator to 65°N in the period 1941 to 1972.
