of science has shown that it is important for analytical scientists to determine not only the presence of particular elements but also their species There are many fields where this is applicable and where there are a number of topics to be addressed

Developing separation and measurement systems for the many element species has tested the resourcefulness of analytical chemists over recent decades A product of the EU sponsored Speciation 21 Network this book presents a detailed review of

the state of the art of speciation issues in the occupational health food and environment sectors along with the main conclusions arising from discussions held during expert meetings Topics covered include mercury and organotin compounds

and at the same time sinks of PHEs and large amounts of metals are recycled or dispersed in the environment posing severe concerns to human health Thanks to the collaboration of numerous colleagues the book outlines the state of art in PHEs research in several countries and is enforced with case studies and enriched with new data not published elsewhere The book will provide to Stakeholders both Scientists Professionals and Public Administrators and also to non specialists a lot of data on the concentrations of metals in soils and the environment and the critical levels so far established in the perspective to improve the environmental quality and the human safety

Mathematical Modeling in Experimental Nutrition Andrew J. Clifford, Hans-Georg Müller, 2013-11-21 Nutrients have been recognized as essential for maximum growth successful reproduction and infection prevention since the 1940s since that time the lion s share of nutrient research has focused on defining their role in these processes Around 1990 however a major shift began in the way that researchers viewed some nutrients particularly the vitamins This shift was motivated by the discovery that modest declines in vitamin nutritional status are associated with an increased risk of ill health and disease such as neural tube defects heart disease and cancer especially in those populations or individuals who are genetically predisposed In an effort to expand upon this new understanding of nutrient action nutritionists are increasingly turning their focus to the mathematical modeling of nutrient kinetic data The availability of suitably tagged isotope nutrients such as B carotene vitamin A folate among others sensitive analytical methods to trace them in humans mass spectrometry and accelerator mass spectrometry and powerful software capable of solving and manipulating differential equations efficiently and accurately has allowed researchers to construct mathematical models aimed at characterizing the dynamic and kinetic behavior of key nutrients in vivo in humans at an unparalleled level of detail
