Space Station Automation III Wun C. Chiou, 1987 **NASA SP-7500** United States. National Aeronautics and Space Administration, **Computer-Aided Mechanical Assembly Planning** Luis S. Homem de Mello, Sukhan Lee, 2012-12-06

Some twenty years have elapsed since the first attempts at planning were made by researchers in artificial intelligence. These early programs concentrated on the development of plans for the solution of puzzles or toy problems like the rearrangement of stacks of blocks. These early programs provided the foundation for the work described in this book: the automatic generation of plans for industrial assembly. As one reads about the complex and sophisticated planners in the current generation, it is important to keep in mind that they are addressing real world problems. Although these systems may become the toy systems of tomorrow, they are providing a solid foundation for future more general and more advanced planning tools. As demonstrated by the papers in this book, the field of computer aided mechanical assembly planning is maturing. It now may include geometric descriptions of parts extracted from or compatible with CAD programs, constraints related to part interference and the use of tools, fixtures and jigs required for the assembly, the nature of connectors, matings and other relations between parts, number of turnovers required during the assembly, handling and gripping requirements for various parts, automatic identification of subassemblies. This is not an exhaustive list but it serves to illustrate the complexity of some of the issues which are discussed in this book. Such issues must be considered in the design of the modern planners as they produce desirable assembly sequences and precedence relations for assembly. **Space Station Systems**, 1989

Dynamics and Control of Multibody Systems Perinkulam Sambamurthy Krishnaprasad, Juan C. Simo, 1989

The study of complex interconnected mechanical systems with rigid and flexible articulated components is of growing interest to both engineers and mathematicians. Recent work in this area reveals a rich geometry underlying the mathematical models used in this context. In particular, Lie groups of symmetries, reduction and Poisson structures play a significant role in explicating the qualitative properties of multibody systems. In engineering applications, it is important to exploit the special structures of mechanical systems. For example, certain mechanical problems involving control of interconnected rigid bodies can be formulated as Lie-Poisson systems. The dynamics and control of robotic aeronautic and space structures involve difficulties in modeling, mathematical analysis and numerical implementation. For example, a new generation of spacecraft with large flexible components are presenting new challenges to the accurate modeling and prediction of the dynamic behavior of such structures. Recent developments in Hamiltonian dynamics and coupling of systems with symmetries has shed new light on some of these issues while engineering questions have suggested new mathematical structures. These kinds of considerations motivated the organization of the AMS-IMS-SIAM Joint Summer Research Conference on Control Theory and Multibody Systems held at Bowdoin College in August 1988. This volume contains the proceedings of that conference. The papers presented here cover a range of topics, all of which could be viewed as applications of geometrical methods to problems

arising in dynamics and control The volume contains contributions from some of the top researchers and provides an excellent overview of the frontiers of research in this burgeoning area *Technology for Large Space Systems* ,1986
