(1859-2021) William Shurtleff; Akiko Aoyagi,2021-09-07 The world s most comprehensive well documented and well illustrated book on this subject With extensive subject and geographic index 107 photographs and illustrations mostly color Free of charge in digital PDF format **Nutrient and energy digestibility in weaned piglets as influenced by feeding level and origin of soy-bean meal in the diet** Miriam Goerke,2014-11-12 Feed is the greatest single cost factor in pig production and protein and energy accounts for the largest proportion of feed costs Therefore it is crucial that the protein and energy content of a diet is characterized in the best possible way Over the past years the standardized ileal digestibility SID of crude protein CP and amino acids AA has been introduced into diet formulation for pigs in several countries Moreover different energy systems are available for feed evaluation including digestible energy DE metabolizable energy ME and net energy NE For soybean meal SBM the most commonly used feed ingredient in pig diets tabulated values for SID of AA in addition to DE ME or NE contents have been determined in grower finisher pigs rather than weaned piglets Due to the lack of separate feed tables for piglets tabulated values originating from experiments with grower finisher pigs are being used for diet formulation in piglet feeding although post weaning feed intake FI is highly variable and often lower than 3 times the maintenance energy requirement of weaned piglets Thus it remains open if values obtained with grower finisher pigs can be used for piglets as well Furthermore in grower finisher pigs it has been shown that dietary inclusion of SBM sources of different origins may affect SID of CP and AA The influence of SBM origin on SID of CP and AA in piglets has not been investigated so far Therefore the first objective of the present thesis was to determine SID of CP and AA in a large variety of SBM sources sourced from different countries whereas the second and third objective was to investigate the effect of FI level

on apparent ileal digestibility AID and SID of CP and AA as well as on apparent total tract digestibility ATTD of proximate nutrients and energy in weaned piglets For this purpose a digestibility experiment with a total of 36 initial BW 5.6 kg newly weaned pigs surgically fitted with simple T cannulas at the distal ileum was conducted The piglets were housed in metabolic crates and were fed semi synthetic diets based on cornstarch and 1 out of 18 different SBM batches originating either from Argentina 6 batches Brazil 6 batches or the United States US 6 batches Diets were fed on three graded levels of FI corresponding to 30 45 and 60 g per kg average body weight BW of piglets equivalent to 50 75 or 100 g/kg BW^{0.75} d or 1.9 2.6 and 3.1 times the energy requirement for maintenance The whole experiment was split in 3 consecutive parts with 12 piglets each Over the whole experiment the piglets were randomly allocated to the different combinations of FI level and SBM but balanced in order to achieve 3 identical experimental parts Chapter 1 of the present thesis provides a brief introduction into the objective of this thesis including background information on SBM production composition and a literature review about studies concerning the impact of SBM origin and the effect of FI level on nutrient digestibility in pigs Chapter 2 includes information on the chemical composition and proximate constituents of the 18 SBM batches originating from Argentina Brazil or the US The average content of CP was greater for Brazilian SBM P 0.05 compared to the other 2 origins Contents of most AA were greater P 0.05 in Brazilian compared to Argentinean SBM batches Amino acid contents in US SBM batches ranged between those from Argentina and Brazil Average trypsin inhibitor activity was greatest P 0.05 in Brazilian SBM Mycotoxins were detected in 8 out of 18 SBM batches but all mycotoxin levels were below their critical benchmarks The contents of individual isoflavones varied considerably among SBM origins P 0.05 The SID of Arg Phe Thr Trp Asp Gly and Ser were greater P 0.05 for US compared to Argentinean SBM batches and intermediate values were obtained for Brazilian SBM batches The SID values were most variable within Argentinean SBM batches and most homogenous within US SBM batches as indicated by a great and a small coefficient of variation respectively However SID of CP and AA were not related to any of the analyzed chemical constituents It was concluded that EU imports of SBM are generally of high quality The obtained SID values contribute substantially to the expansion of databases on SID of CP and AA in SBM from the 3 major soybean producing countries for piglets However SID values obtained with piglets were considerably lower compared with tabulated values originating from grower finisher pigs Thus further studies are warranted to confirm that finally separate feed tables for ingredients used in diet formulation for piglets are required to account for these differences In Chapter 3 the effect of 3 graded levels of FI on AID and SID of CP and AA in SBM based diets was determined in piglets The AID and SID of most AA were quadratically affected by the FI level P 0.05 Initially both AID and SID of most AA increased up to 1.9 % units as the FI level was increased from 30 to 45 g/kg BW Thereafter these AID and SID values decreased by 2.6 and 2.7 % units respectively as the FI level was further increased from 45 to 60 g/kg BW It was concluded that there is a significant effect of feed intake level albeit of small magnitude on AID and SID of CP and AA which

possibly has to be accounted for in feed tables due to the high variability of voluntary FI post weaning In Chapter 4 the effect of 3 graded FI levels on AID and ATTD of proximate nutrients and energy as well as on estimates of dietary DE ME and NE contents was investigated Due to the graded level of FI and thereby the graded intake of nutrients ileal endogenous nutrient losses and or total tract endogenous nutrient losses could be estimated by linear regression analysis and true digestibility values as well as urinary endogenous N losses could be calculated The AID of DM N and energy as well as ATTD of neutral detergent fiber acid detergent fiber and ether extract EE in the assay diets was not affected P 0 05 by FI level However there was a small decrease in ATTD of DM N OM ash and energy as well as in DE ME and NE content in the assay diets P
