Optogenetic Reverse-engineering of Brain Sleep/wake Circuitry Matthew Evan Carter, 2011 The neural control of sleep and wakefulness depends upon a complex and partially defined balance between subcortical excitatory and inhibitory populations in the brain Wake active neurons include hypocretin Hcrt containing neurons in the lateral hypothalamus and noradrenergic neurons that make up the brainstem locus coeruleus LC Experimentally determining a causal role for these neurons in promoting and maintaining wakefulness has remained elusive using traditional pharmacological and electrical techniques due to their small size unique morphology and proximity to heterogeneous neuronal and non neuronal cell types The recent development of optogenetic technology provides a toolkit of genetically encodable millisecond timescale stimulation and inhibition probes that can be targeted to specific cell types with no toxicity to the cells under investigation This dissertation discusses the application of optogenetic tools to questions about sleep wake circuitry and uses these tools to study Hcrt and LC neurons both individually and in combination
