IUTAM Symposium on Surface Effects in the Mechanics of Nanomaterials and Heterostructures Alan

Cocks, Jianxiang Wang, 2012-09-26 This volume constitutes the proceedings of the IUTAM Symposium on Surface Effects in the Mechanics of Nanomaterials and Heterostructures held in Beijing 8-12 August 2010. The symposium brought together the most active scientists working in this area from the fields of solid mechanics, composites, physics and materials science and summarized the state of the art research results with a view to advancing the frontiers of mechanics and materials physics. Nanomaterials and heterostructures have a large fraction of their atoms at surfaces and interfaces. These atoms see a different environment to those in the interior and can have a substantial effect on the overall mechanical and physical behaviour of a material. The last decade has witnessed a growing interest in the study of surfaces and how the surface behaviour couples with that of the bulk to determine the overall system response. The papers in this proceedings cover extension of continuum mechanics and thermodynamics to the nano scale, multiscale simulations, surface effects in monolithic nano scale elements and nanostructures, mechanical and physical properties of nanomaterials and heterostructures, self assembly etc. The surface stress effect is inherently a multidisciplinary and fertile field. The Symposium truly reflects these features. This IUTAM Symposium was also dedicated to Professor Bhushan L. Karihaloo of Cardiff University on his impending retirement in recognition of his contributions to the fields of solid mechanics and nanomechanics and to IUTAM activities in general. *Proceedings of the Symposium on Electrochemical Surface Science of Hydrogen Adsorption and Absorption*

Gregory Jerkiewicz, Philippe Marcus, 1997 **IUTAM Symposium on Creep in Structures** S. Murakami, N. Ohno, 2013-11-27 The advent of steam turbines and the sudden rise of steam temperature at the beginning of the 20th century gave a great impetus to the start of scientific research on metal creep and high temperature strength. Then aeronautical and aerospace exploitation in the 1940s and 1950s enlarged the scope of creep research. In this context the first IUTAM Symposium on Creep in Structures was held at Stanford University in July 1960 and about 60 participants from seven countries around the world discussed their recent results on this problem. Subsequent innovation in science and technology as in nuclear and new energy technology, new materials, large scale integration of semiconductors etc. has claimed solutions to new and challenging problems in this fundamental field of applied mechanics. In order to discuss the new topics in this discipline the IUTAM Symposia Creep in Structures thereafter have been held every ten years, i.e. the second in 1970 at Gothenburg, Sweden, the third in 1980 at Leicester, U.K. and the fourth in 1990 at Cracow, Poland. The First 1960 and Second Symposium 1970 were concerned mainly with the phenomenological law of creep and creep analysis of structural elements, whereas the issues of the Third Symposium 1980 shifted toward the problems of creep damage, creep crack growth, practical and effective design methods etc. **Proceedings of the Symposium on Surface Oxide Films** Jennifer A. Symposium on Laminar-Turbulent Transition Philipp Schlatter, Dan S. Henningson, 2010-03-11 The origins of turbulent

ow and the transition from laminar to turbulent ow are the most important unsolved problems of uid mechanics and aerodynamics sides being a fundamental question of uid mechanics there are numerous app cations relying on information regarding transition location and the details of the subsequent turbulent ow For example the control of transition to turbulence is pecially important in 1 skin friction reduction of energy ef cient aircraft 2 the performance of heat exchangers and diffusers 3 propulsion requirements for personic aircraft and 4 separation control While considerable progress has been made in the science of laminar to turbulent transition over the last 30 years the c tinuing increase in computer power as well as new theoretical developments are now revolutionizing the area It is now starting to be possible to move from simple 1D eigenvalue problems in canonical ows to global modes in complex ows all companied by accurate large scale direct numerical simulations DNS Here novel experimental techniques such as modern particle image velocimetry PIV also have an important role Theoretically the in uence of non normality on the stability and transition is gaining importance in particular for complex ows At the same time the enigma of transition in the oldest ow investigated Reynolds pipe ow tran tion experiment is regaining attention Ideas from dynamical systems together with DNS and experiments are here giving us new insights
