which is the focus of this book How does irreversibility at the macroscopic level emerge from the reversibility that prevails at the molecular level Attempts to explain the emergence have emphasized probability and assigned different probabilities to the forward and reversed directions of processes so that one direction is far more probable than the other The conclusion is promising but the reasons for it have been obscure In many cases the aim has been to find an explanation in the nature of probability itself Reactions to that have been divided some think the aim is justified while others think it is absurd

The Nature of Time J. Woods Halley, 2022-12-02 This book reviews and contrasts contemporary and historical perceptions of time from scientific and intuitive human points of view Ancient and modern clocks Augustinian ideas the deterministic Newtonian universe biological clocks deep time thermodynamics quantum mechanics and relativity all contribute to the perspective The focus is on what can be inferred from established technologies and science as opposed to futuristic speculation Chapter 1 describes clocks including the cesium atomic clocks establishing the current global time standard a history of clock development biological clocks phylogenetic trees radioactive dating and astronomical methods to determine the age of the universe Chapter 2 poses ancient questions about time not fully addressed by an understanding of the technical nature of clocks An early summary of some of these questions as described by Augustine in the 3rd century CE is followed by a description of how Newton 1300 years later introduced a conception of time which provided some answers such as the nature of an infinitesimally short present Implications concerning the reality of events in the past present and future are also discussed The Newtonian picture is contrasted with the intuitive human one and the possibilities of time travel and temporal recurrence are briefly discussed Chapter 3 introduces the second law of thermodynamics and addresses how it is compatible with a time reversible Newtonian description of a universe even though it appears to define an arrow of time The nature of entropy and its relation to coarse graining and emergence play a central role in the discussion Chapter 4 discusses ways in which quantum mechanics has altered the Newtonian perspective accounting for various interpretations of the meaning of quantum mechanics with regard to time Chapter 5 describes basic elements of special relativity and their implications for the nature of time Examples of time dilation and the changing order of space such as separated events in different frames are described The examples are chosen to avoid evocation of currently unattainable technologies An afterword in chapter 6 reviews questions raised by Augustine and summarizes how the development of science since then has addressed them This book was originally developed for an interdisciplinary seminar for beginning undergraduates at the University of Minnesota It uses a small amount of algebra mainly in supplementary appendices and does not assume any prior knowledge of physics chemistry biology or astronomy In contrast to many semipopular books on time it avoids speculation either about engineering techno optimism or physical theory strings loop quantum gravity black hole entropy Instead it takes a more grounded approach and

describes what is currently known and not known to help both students and the general reader make better sense of time

The Nature of Nature Irv Dardik, Estee Dardik Lichter, 2017-05-16 Generations of researchers have failed to answer our most basic questions about nature What is everything made of How do things change and how do they work What is life In The Nature of Nature visionary scientist Irv Dardik tackles these questions by introducing his discovery of SuperWaves a singular wave phenomenon whose design generates what we experience as matter space time motion energy and order and chaos Simply put the SuperWaves principle states that the fundamental stuff of nature is waves waves waving within waves to be exact Dardik challenges the rationality of accepting a priori that the universe is made of discrete particles Instead by drawing from his own discovery of a unique wave behavior and combining it with scientific facts he shows that every single thing in existence from quantum particles to entire galaxies is waves waving in the unique pattern he calls SuperWaves The discovery of SuperWaves and the ideas behind it while profound can be intuitively grasped by every reader whether scientist or layperson Touching on everything from quantum physics to gravity to emergent complexity and thermodynamics to the origins of health and disease it shows that our health and the health of the environment and civilization depend upon our understanding SuperWaves The Nature of Nature is an absorbing account that combines Dardik's contrarian look at the history of science with philosophical discussion his own groundbreaking research and hope for the future **The Nature of**

Kolobov, 2018-12-31 This book presents the genetic connections of metamorphism and geodynamics. It discusses the tectonic and magmatic processes as the reason of metamorphism and the geological types of metamorphism which define the features of parameters and t paths. Three categories of metamorphism are distinguished depending on the heat flow rate: 1 at a geothermal gradient near to an average terrestrial normal value; 2 at a heightened thermal gradient as the result of additional heat supply in the earth's crust by magmatic intrusions and diapirism of magma; 3 at a reduced thermal gradient during the collision of lithosphere plates and blocks of the earth's crust. The quantitative methods of description of metamorphism have been widely used in this book. The mathematical models of metamorphism have been studied in connection with magmatic intrusions, rifting process and magmatic diapirism. Mineral changes in the rocks controlled by variations of parameters, mass transfer and chemical reactions have also been characterized. The book proposes a quasi-stationary model of diffusion metasomatism with respect to the formation of zonal structures of minerals. The method of mineral thermobarometry for the conditions of unsteady equilibrium has been worked out. The quantitative analysis of mass transfer during metamorphic reactions in the rock matrix has been carried out and the mobility of chemical elements at metamorphism has been estimated as well. The book is intended for specialists in the fields of petrology, mineralogy and geochemistry and for students at the senior and graduate level.
