Soap Bubbles Their Colors The Forces W:

Soap Bubbles Charles Vernon Boys, 1962 A new edition of a classic scientific work by an English physicist examining the forces that act on liquids and other common phenomena through experiments on a soap bubble With a biography of the author Book Buyer's Guide

The Mathematics of Soap Films: Explorations with Maple John Oprea, 2000 Nature tries to minimize the surface area of a soap film through the action of surface tension The process can be understood mathematically by using differential geometry complex analysis and the calculus of variations This book employs ingredients from each of these subjects to tell the mathematical story of soap films The text is fully self contained bringing together a mixture of types of mathematics along with a bit of the physics that underlies the subject The development is primarily from first principles requiring no advanced background material from either mathematics or physics Through the Maple applications the reader is given tools for creating the shapes that are being studied Thus you can see a fluid rising up an inclined plane create minimal surfaces from complex variables data and investigate the true shape of a balloon Oprea also includes descriptions of experiments and photographs that let you see real soap films on wire frames The theory of minimal surfaces is a beautiful subject which naturally introduces the reader to fascinating yet accessible topics in mathematics Oprea's presentation is rich with examples explanations and applications It would make an excellent text for a senior seminar or for independent study by upper division mathematics or science majors

Constant Mean Curvature Surfaces with Boundary Rafael López, 2013-08-31 The study of surfaces with constant mean curvature CMC is one of the main topics in classical differential geometry Moreover CMC surfaces are important mathematical models for the physics of interfaces in the absence of gravity where they separate two different media or for capillary phenomena Further as most techniques used in the theory of CMC surfaces not only involve geometric methods but also PDE and complex analysis the theory is also of great interest for many other mathematical fields While minimal surfaces and CMC surfaces in general have already been treated in the literature the present work is the first to present a comprehensive study of compact surfaces with boundaries narrowing its focus to a geometric view Basic issues include the discussion whether the symmetries of the curve inherit to the surface the possible values of the mean curvature area and volume stability the circular boundary case and the existence of the Plateau problem in the non parametric case The exposition provides an outlook on recent research but also a set of techniques that allows the results to be expanded to other ambient spaces Throughout the text numerous illustrations clarify the results and their proofs The book is intended for graduate students and researchers in the field of differential geometry and especially theory of surfaces including geometric analysis and geometric PDEs It guides readers up to the state of the art of the theory and introduces them to interesting open problems

concepts **Physical Models** Bill Addis, Karl-Eugen Kurrer, Werner Lorenz, 2020-09-25 Physical models have been and continue to be used by engineers when faced with unprecedented challenges when engineering science has been inadequate or even non-existent and in any other situation when engineers have needed to raise their confidence in a design proposal to a sufficient level in order to begin construction. For this reason, models have mostly been used by designers and constructors of highly innovative projects when previous experience has not been available. The book covers the history of using physical models in the design and development of civil and building engineering projects including Robert Stephenson's Britannia Bridge in the 1840s, the masonry Aswan Dam in the 1890s and the Boulder Dam in the 1930s, tidal flow in estuaries and wind and seismic loads on structures from the 1890s, the acoustics of concert halls and the design of thin concrete shell roofs from the 1920s and the dynamic behaviour of tall buildings from the 1930s as well as cable net and membrane structures in the 1960s. Individual designers featured include Eduardo Torroja, Pier Luigi Nervi, Heinz Hossdorf, Heinz Isler, Frei Otto, Sergio Musmeci and Mamoru Kawaguchi. The book concludes with overviews of the current use of physical models alongside computer models, for example in boundary layer wind tunnels, seismic engineering, hydrology, soil mechanics and air flow in buildings. Traditionally, progress in engineering has been attributed to the creation and use of engineering science, the understanding of materials properties and the development of new construction methods. The book argues that the use of reduced scale models has played an equally important part in the development of civil and building engineering. However, like the history of engineering design itself, this crucial contribution has not been widely reported or celebrated. The book includes 39 chapters written by 29 authors from ten different countries.
