International Conference on Mathematics and Statistics AUS ICMS 2020 held at the American University of Sharjah United Arab Emirates from 6-9 February 2020. This conference was held in honour of the work of the distinguished algebraist Daniel D. Anderson. Many participants and colleagues from around the world felt it appropriate to acknowledge his broad and sweeping contributions to research in algebra by writing an edited volume in his honor. The topics covered are inevitably a cross section of the vast expansion of modern algebra. The book is divided into two sections: surveys and recent research developments, with each section hopefully offering symbiotic utility to the reader. The book contains a balanced mix of survey papers which will enable expert and non-expert alike to get a good overview of developments across a range of areas of algebra. The book is expected to be of interest to both beginning graduate students and experienced researchers.

Stranger's Knowledge Xavier Marquez, 2012-06-07. The *Statesman* is a difficult and puzzling Platonic dialogue. In *A Stranger's Knowledge*, Marquez argues that Plato abandons here the classic idea prominent in the *Republic* that the philosopher qua philosopher is qualified to rule. Instead, the dialogue presents the statesman as different from the philosopher, the possessor of a specialist expertise that cannot be reduced to philosophy. The expertise is of how to make a city resilient against internal and external conflict in light of the imperfect sociality of human beings and the poverty of their reason. This expertise, however, cannot be produced on demand; one cannot train statesmen like one might train carpenters. Worse, it cannot be made acceptable to the citizens or operate in ways that are not deeply destructive to the city's stability. Even as the political community requires his knowledge for its preservation, the genuine statesman must remain a stranger to the city. Marquez shows how this impasse is the key to understanding the ambiguous reevaluation of the rule of law that is the most striking feature of the political philosophy of the *Statesman*. The law appears here as a mere approximation of the expertise of the inevitably absent statesman: dim images and static snapshots of the clear and dynamic expertise required to steer the ship of state across the storms of the political world. Yet such laws, even when they are not created by genuine statesmen, can often provide the city with a limited form of cognitive capital that enables it to preserve itself in the long run, so long as citizens and especially leaders retain a philosophical attitude towards them. It is only when rulers know that they do not know better than the laws what is just or good and yet want to know what is just and good that the city can be preserved. The dialogue is thus, in a sense, the vindication of the philosopher-king in the absence of genuine political knowledge.

Representation Theory of Algebras and Related Topics Raymundo Bautista, Roberto Martínez-Villa, José Antonio de la Peña, 1996. The 14 selected papers discuss recent thinking and findings on the representation theory of algebras and its interaction with other areas of mathematics such as algebraic geometry, ring theory, and the representation of groups. The topics include coils and multicoil algebras, representations of wild quivers, the Tits form of a tame algebra, almost split sequences and triangles for Artin algebras, and orders and using approximations to analyze the structure of representations. Handbook of Elliptic and Hyperelliptic Curve Cryptography Henri Cohen, Gerhard Frey, Roberto Avanzi, Christophe Doche, Tanja Lange, Kim Nguyen, Frederik Vercauteren, 2005-07-19 The discrete logarithm problem based on elliptic and hyperelliptic curves has gained a lot of popularity as a cryptographic primitive The main reason is that no subexponential algorithm for computing discrete logarithms on small genus curves is currently available except in very special cases Therefore curve based cryptosystems require much smaller key sizes than RSA to attain the same security level This makes them particularly attractive for implementations on memory restricted devices like smart cards and in high security applications The Handbook of Elliptic and Hyperelliptic Curve Cryptography introduces the theory and algorithms involved in curve based cryptography After a very detailed exposition of the mathematical background it provides ready to implement algorithms for the group operations and computation of pairings It explores methods for point counting and constructing curves with the complex multiplication method and provides the algorithms in an explicit manner It also surveys generic methods to compute discrete logarithms and details index calculus methods for hyperelliptic curves For some special curves the discrete logarithm problem can be transferred to an easier one the consequences are explained and suggestions for good choices are given The authors present applications to protocols for discrete logarithm based systems including bilinear structures and explain the use of elliptic and hyperelliptic curves in factorization and primality proving Two chapters explore their design and efficient implementations in smart cards Practical and theoretical aspects of side channel attacks and countermeasures and a chapter devoted to pseudo random number generation round off the exposition The broad coverage of all important areas makes this book a complete handbook of elliptic and hyperelliptic curve cryptography and an invaluable reference to anyone interested in this exciting field *Agricultural Economics Bibliography* United States.
