

picture. For instance, when describing the cavity magnetron which was taken by the Tizard Mission to the States in August 1940, the author does not explain how it came about that this version with eight cavities and not the British one with six became established in America, which has been recounted by E. G. Bowen in *Radar Days* (Adam Hilger, 1987), pp. 164–70, in which he gives a highly personal account of this event. The book's strength is that Brian Callick is fully conversant with the technical details of this wartime R. & D. From 1946 he was for three years the CVD representative in Washington, DC. This book is a most useful quarry for future historians interested in the Royal Navy's radar work. Incidentally, such a wartime history has been in preparation for some years and could appear shortly. It has the full backing of those who were involved with this development.

DESMOND KING-HELE, *A Tapestry of Orbits*. Cambridge: Cambridge University Press, 1992. Pp. x + 244. ISBN 0-521-39323-X. £35.00.

In the Preface the author states that this book is a personal account of the researches based on analysis of satellite orbits between 1957 and 1990 at the Royal Aircraft Establishment (RAE), Farnborough. In fact the book is much more than this, containing fascinating glimpses of the author's personal life and comments on life in general during these years.

A young graduate in mathematics from Trinity College, Cambridge, Desmond King-Hele joined the RAE in 1948 and remained there until his retirement in 1988. There he developed the mathematical theory of orbital analysis so that when the first satellite (Sputnik 1) was launched on 4 October 1957, he was ready to accept the challenge of putting his theories to the test. He had essentially used Newton's laws to determine the orbits of satellites, and at a meeting of the Royal Society in 1987 to celebrate the 300th anniversary of the publication of Newton's *Principia*, he commented 'I have spent 30 years

extending the theory of the *Principia* to the orbits of satellites. I have never heard of Einstein; for me, Newton's laws still rule.' He was particularly pleased to discover that a result he had established in 1956 for the descent of a satellite through the Earth's atmosphere was not new, but had been derived by Newton in the *Principia*, although apparently not recognized in any of the literature of the last century.

Analysis of a satellite's orbits can be used for two main purposes – to estimate the density of the Earth's upper atmosphere and to refine our knowledge of the shape of the Earth and its gravitational field. Over the years King-Hele extended his theoretical analysis to higher and higher orders of accuracy. The book contains enough mathematics to enable one to appreciate the work involved, but no details to deter the non-mathematical reader. Geodesists who had been studying the shape of the Earth for more than 200 years were initially sceptical of his work, although they gradually came to appreciate that their 'laborious measurements were wrong'.

The launch of Sputnik 2 (about 4.30 a.m. on 3 November 1957 – at about the same time of day as the author had been born thirty years earlier) created even more excitement in Britain. The Royal Festival Hall in London was filled with an enthusiastic audience for a conference entitled 'Britain enters the Space Age' at which the Duke of Edinburgh, Arthur C. Clarke and the author were amongst the speakers – by chance Sputnik 2 came down a few hours before he was due to speak.

King-Hele had many contacts with scientists abroad and was in constant demand to write articles and speak at conferences. With the head-start he had on orbital analysis, he was able to make 'piratic' use of the satellites launched by the USSR (they were very appreciative of his work) and on one occasion to publish results before the US scientists for whom a satellite had been launched.

In the 1960s when it was shown that the Earth was pear-shaped, the subject still attracted popular interest, but, by and large, the work, though valuable, was not glamorous and did not attract grants. Also the early satellites were 'passive', that is, they contained no equipment
