Eocene-Oligocene Climatic and Biotic Evolution Donald R. Prothero, William A. Berggren, 2014-07-14 The transition from the Eocene to the Oligocene epochs was the most significant event in earth history since the extinction of dinosaurs As the first Antarctic ice sheets appeared major extinctions and faunal turnovers took place on the land and in the sea eliminating forms adapted to a tropical world and replacing them with the ancestors of most of our modern animal and plant life Through a detailed study of climatic conditions and of organisms buried in Eocene Oligocene sediments this volume shows that the separation of Antarctica from Australia was a critical factor in changing oceanic circulation and ultimately world climate In this book forty eight leading scientists examine the full range of Eocene and Oligocene phenomena Their articles cover nearly every major group of organisms in the ocean and on land and include evidence from paleontology stable isotopes sedimentology seismology and computer climatic
