*The United States Department of Commerce Publications, Catalog and Index Supplement* United States. Department of Commerce, 1973      *The Measure of All Things* Ken Alder, 2014-07-29 In June 1792 amidst the chaos of the French Revolution two intrepid astronomers set out in opposite directions on an extraordinary journey Starting in Paris Jean Baptiste Joseph Delambre would make his way north to Dunkirk while Pierre Fran ois Andr M chain voyaged south to Barcelona Their mission was to measure the world and their findings would help define the meter as one ten millionth of the distance

between the pole and the equator a standard that would be used for all people for all time The Measure of All Things is the astonishing tale of one of history's greatest scientific adventures Yet behind the public triumph of the metric system lies a secret error one that is perpetuated in every subsequent definition of the meter As acclaimed historian and novelist Ken Alder discovered through his research there were only two people on the planet who knew the full extent of this error Delambre and Mechain chain themselves By turns a science history detective tale and human drama The Measure of All Things describes a quest that succeeded as it failed and continues to enlighten and inspire to this day

*Introduction To Radiation Protection Dosimetry* Jozef Sabol, Pao-shan Weng, 1995-04-28 One essential characteristic of life is the exchange of matter and energy between organisms and their environment Radiation is a form of energy that has always been around in nature and will forever be the companion of human beings throughout life In order to assess the impact of radiation exposures properly it is essential to introduce appropriate quantities and units which can then be used for quantification of exposures from various sources In principle radiation protection is mainly aimed at controlling radiation exposure while radiation dosimetry deals primarily with the measurement of relevant radiation quantities especially doses This book is divided into two parts The first contains up to date definitions of the most significant radiation quantities including their interpretation In the second part the exposures of both individuals and population at large to various types of natural and man made sources are compared and discussed The concept of quantities and units as well as analysis of exposure due to various sources in our environment is based on the latest highly regarded authentic sources such as ICRU ICRP IAEA and particularly UNSCEAR reports and recommendations The material reflects the latest review of the current terminology in radiation protection dosimetry and the contemporary assessment of radiation exposures of the population radiation workers and patients
