Bosma, Robert A. Phillips, Walter Schuler, 2013-03-07 During routine genetic screening of several immunoglobulin heavy chain congenic mouse strains in 1980 one of us MB was surprised to find that several mice in the C B

17IIcr strain which was being maintained in a specific pathogen free facility of the Fox Chase Cancer Center Philadelphia PA did not express serum immunoglobulin of the appropriate allotype Fearing an error in the breeding of these mice the sera of the suspect mice were screened for other allotypes When these tests revealed a complete absence of serum immunoglobulin it became apparent that a mutation had probably occurred in the C B 17IIcr line Further analysis revealed that a single breeding pair was responsible for all of the immunoglobulin negative mice and that the defect showed recessive inheritance Thus was the C B 17 Icr scid or severe combined immune deficient scid mouse discovered Although it has taken most animal facilities several years to breed scid mice of high quality for experimental purpose it was clear by 1987 that many investigators were beginning to exploit the unique qualities of the scid mouse for studies in several areas

third volume in the four volume set *The Mouse in Biomedical Research* is a completely new addition to this series dedicated to mouse immunology. It is based on the vast body of knowledge which has made the mouse the model of choice when studying immunity in man. Arguably more is known about the immune system in mice than any other species except man. In large part this is due to the power of genetic engineering to delineate molecular mechanisms. In this volume we present an Overview to mouse immunology including both the innate and adaptive immune systems followed by 15 chapters each dealing with a specific area of immunology in the mouse. These chapters illustrate the power of genetic engineering in dissecting each component of the immune response from the development of lymphoid tissues to signal transduction pathways in activated cells.
