Investigation of an Automatic Spin-prevention System for Fighter Airplanes William P. Gilbert, Charles E. Libbey, 1972 An investigation was conducted to evaluate the effectiveness of an automatic spin prevention system for current fighter airplanes as a first step in determining the feasibility of such a system The concept makes use of the components of the conventional flight control system with the addition of control logic to monitor angle of attack yaw rate and normal acceleration Analytical techniques were used to study the system concept applied to three representative fighter configurations and model flight tests were employed to evaluate a prototype system on a representative fighter configuration Emphasis was placed on the development of the control logic required A discussion of possible implementations of the system concept is presented Results of the investigation indicated that a relatively simple system with full control authority was effective in preventing the developed spins of the fighter configurations considered and that the system design is dependent on the stall and spin characteristics of the particular airplane

Investigation of the Model ME 210 in the Spin Wind Tunnel of the DVL. A. Huffs Schmid, 1950 After conclusion of the spin investigation of the model ME 210 with elongated fuselage and central vertical tail surfaces model condition III reference 3 tests were performed on the same model with a vee tail model condition IV Here the entire tail surfaces consist of only one surface with pronounced dihedral Since the blanketing of the vertical tail surfaces by the horizontal tail surfaces which may occur in case of standard tail surfaces does not occur here one could expect for this type of tail surface favorable spin characteristics particularly with respect to rudder effectiveness for spin recovery However the test results did not confirm these expectations The steady spin was shown to be very irregular regarding rudder effectiveness the vee tail surfaces proved to be inferior even to standard tail surfaces thus they represent the most unfavorable of the four fuselage and tail surface combinations investigated so far
