

COLDER TIMES

Approximately 20,000 years ago, this is what our planet looked like: the sea level was 125 meters lower, the climate was colder and drier but most importantly, huge ice sheets covered continents since the average temperature was 6°C lower than it is today. From ocean currents, to the fauna and flora, including coastlines and seas, everything was radically different.

The ice sheets of North and a huge continental glacier sheet extended across North America and a lot of the land that is now the ocean.

The temperature was not necessarily as cold as we think it is today because the sea level was lower.

There is a lot of ice in the world today, but the amount of ice on the continent is much smaller than it was during the last ice age.

The ice sheets were not continuous across the entire continent, but they were very large and covered most of the land.

There is a lot of ice in the world today, but the amount of ice on the continent is much smaller than it was during the last ice age.

The Ice Age World:

The Ice Age World Bjørn Grothaug Andersen, Harold W. Borns, 1994 In presenting an enchanting and colorful tale of the ice age history this book provides an informative and much needed survey of geological history over the past 2.5 million years. Dramatic changes took place in this period both in climate and physical geographical conditions. Striking landscape features were formed and sediments were deposited which are of utmost importance for the global environment including vegetation, animal life, and human life. Topics of the book include evolution of the glacial theory, scientific techniques, warming and deglaciation, and early humans among many others. Expertly written by two leading scientists who have contributed greatly to our understanding of the ice age world, the book is lavishly illustrated and contains numerous enlightening maps. It will appeal to all students and researchers involved in the earth and atmospheric sciences. Roses at Dawn in an Ice Age World Rolf Witzsche, 2005 Mankind is the child of the Ice Age. Our more than 2 million year history extends through the entire Pleistocene Ice Age Epoch. We were shaped by the need to be creative to survive and still are. Now that our warm interglacial epoch is nearly over, we find ourselves challenged to be creative once again as the global agriculture and with it our food supply will be radically diminished once we get back into the Ice Age World. Can we protect our agriculture in indoor facilities? That sounds like science fiction, right? It will take a hundred years to do it. But will we upgrade our human dimension to do it especially in the way we relate to one another as human beings? We are deeply divided to the very grassroots social level and isolated. The needed Ice Age Renaissance requires a taller foundation. The novel explores the countless dimensions that are involved in breaking the ice in our social domain at the level of sexual and marital division and isolation towards becoming sublime as human beings. The great renaissance principles of universal love and of the advantage of the other are threaded through the story, putting a new light on sex and marriage relationships and expanding them into the universal dimension. This novel is Episode 2B of the science fantasy series *The Lodging for the Rose* by Rolf A. F. Witzsche. *The Ice Age Challenge* Rolf A. F. Witzsche, 2005-03-01 The Ice Age Challenge refers to the challenge that we face globally to create a new foundation for living when the coming Ice Age climate shuts down most of the world's agriculture, possibly 100 to 150 years from now. The novel is the first part of the second episode of the series *The Lodging for the Rose*, an eight-part science fantasy centered on universal love by Rolf A. F. Witzsche. We truly are in a race against time, the greatest race since the dawn of man, racing to create the technologies, economies, finances, politics, and social cultures that enable us to shift agriculture into efficient indoor facilities in order to protect our food production in the coming Ice Age environment. The Earth has been in an Ice Age for 1.8 million years, interspersed by the occasional warm period like the present one that is ending in spite of global warming. The necessary infrastructures for survival are technologically feasible, but will we empower ourselves to create them? That appears to be less certain. It seems that we have been put in a race without the skills for it. But then don't we have the potential to be fast learners? In the course of exploring the question, the novel touches on the collapse of the Soviet

Discovering the Ice Ages Tobias Krüger,2013-06-17 Tobias Krüger explores the discovery of the Ice Ages how the idea was received and what further research it stimulated The approach used in Discovering the Ice Ages is uniquely sweeping The contemporary debates on the subject are compared from an international perspective Krüger retraces the arguments advanced from the middle of the 18th century to the threshold of the 20th century The positions held by defenders of the glacial theory as well as those by its most important opponents are set within the context of the then current understanding of geology In an interdisciplinary overview Krüger then focuses on the impetus gained from early ice age research The most prominent examples worth mentioning are the discovery of trace gases and the greenhouse effect

Anderson,Andrew Goudie,Adrian Parker,2013-02-07 This book delves into the environmental changes that have taken place during the Quaternary the two to three million years during which humans have inhabited the Earth and conveys the relevance of the study of this period to current environmental and climatic concerns Four Degrees of Global Warming Peter Christoff,2013-10-15 At Copenhagen in December 2009 the international community agreed to limit global warming to

below two degrees Celsius to avoid the worst impacts of human induced climate change. However, climate scientists agree that current national emissions targets collectively will still not achieve this goal. Instead, the ambition gap between climate science and climate policy is likely to lead to average global warming of around four degrees Celsius by or before 2100. If a Four Degree World is the de facto goal of policy, we urgently need to understand what this world might look like. *Four Degrees of Global Warming: Australia in a Hot World* outlines the expected consequences of this world for Australia and its region. Its contributors include many of Australia's most eminent and internationally recognized climate scientists, climate policy makers, and policy analysts. They provide an accessible, detailed, dramatic, and disturbing examination of the likely impacts of a Four Degree World on Australia's social, economic, and ecological systems. The book offers policy makers, politicians, students, and anyone interested in climate change access to the most recent research on potential Australian impacts of global warming and possible responses. *Ice Ages, Recent and Ancient* Arthur Philemon Coleman, 1926
