

Steps to solving Systems of Equations by Substitution:

$$x + 3y = 6$$

$$2x + 8y = -12$$

1. Isolate a variable in one of the equations. (Either $y =$ or $x =$).

$$x + 3y = 6$$

$$x = 6 - 3y$$

2. Substitute the isolated variable in the other equation.

$$2x + 8y = -12$$

$$2(6 - 3y) + 8y = -12$$

3. This will result in an equation with one variable. Solve the equation.

$$12 - 6y + 8y = -12$$

$$2y = -24$$

$$y = -12$$

4. Substitute the solution from step 3 into another equation to solve for the other variable.

$$x + 3(-12) = 6$$

$$x = 42$$

5. Recommended: Check the solution.

$$42 = 6 - 3(-12)$$

Anaphoric Relations in English and French Francis Cornish, 2015-07-03 First published in 1986 this book focuses on Anaphoric relations in the English and French languages a phenomenon that involves a complex interaction between grammar and discourse Studies of anaphora taking a largely textual approach to the subject have tended to underestimate the effect upon its formation of referential and discourse factors while studies framed within a psycholinguistic and computational perspective have been inclined to minimise the importance of the purely linguistic features connected with anaphora This volume places the study of anaphora upon a firmer foundation by examining both its nature and functions in discourse by pinpointing the range of factors relevant to its operation in the two languages under study and by attempting to relate the textual and interactional perspectives within a more comprehensive framework

Lerner, Boris L. Althsuler, Vladimir I. Fal'ko, Thierry Giamarchi, 2002-07-31 The physics of strongly correlated fermions and bosons in a disordered environment and confined geometries is at the focus of intense experimental and theoretical research efforts Advances in material technology and in low temperature techniques during the last few years led to the discoveries of new physical phenomena of atomic gases and a possible metal phenomena including Bose condensation insulator transition in two dimensional high mobility electron structures Situations where the electronic system is so dominated by interactions that the old concepts of a Fermi liquid do not necessarily make a good starting point are now routinely achieved This is particularly true in the theory of low dimensional systems such as carbon nanotubes or in two dimensional electron gases in high mobility devices where the electrons can form a variety of new structures In many of these systems disorder is an unavoidable complication and lead to a host of rich physical phenomena This has pushed the forefront of fundamental research in condensed matter towards the edge where the interplay between many body correlations and quantum interference enhanced by disorder has become the key to the understanding of novel phenomena **Pair Correlations in Many-Fermion Systems** Vladimir Z.
