

What is social experimentation?

- Social experimentation relates to testing innovative solutions at small scale and measuring its specific impact on beneficiaries with a view to disseminating them widely.
- Social experiments are a more specific tool than mutual learning projects, social innovation projects or pilot projects.
- « How to better implement what is designed on paper? » It is an action-oriented tool.

Experiments Howard S. Bloom,2005-06-10 Policy analysis has grown increasingly reliant on the random assignment experiment a research method whereby participants are sorted by chance into either a program group that is subject to a government policy or program or a control group that is not Because the groups are randomly selected they do not differ from one another systematically Therefore any differences between the groups at the end of the study can be attributed solely to the influence of the program or policy But there are many questions that randomized experiments have not been able to address What component of a social policy made it successful Did a given program fail because it was designed poorly

or because it suffered from low participation rates In Learning More from Social Experiments editor Howard Bloom and a team of innovative social researchers profile advancements in the scientific underpinnings of social policy research that can improve randomized experimental studies Using evaluations of actual social programs as examples Learning More from Social Experiments makes the case that many of the limitations of random assignment studies can be overcome by combining data from these studies with statistical methods from other research designs Carolyn Hill James Riccio and Bloom profile a new statistical model that allows researchers to pool data from multiple randomized experiments in order to determine what characteristics of a program made it successful Lisa Gennetian Pamela Morris Johannes Bos and Bloom discuss how a statistical estimation procedure can be used with experimental data to single out the effects of a program's intermediate outcomes e g how closely patients in a drug study adhere to the prescribed dosage on its ultimate outcomes the health effects of the drug Sometimes a social policy has its true effect on communities and not individuals such as in neighborhood watch programs or public health initiatives In these cases researchers must randomly assign treatment to groups or clusters of individuals but this technique raises different issues than do experiments that randomly assign individuals Bloom evaluates the properties of cluster randomization its relevance to different kinds of social programs and the complications that arise from its use He pays particular attention to the way in which the movement of individuals into and out of clusters over time complicates the design execution and interpretation of a study Learning More from Social Experiments represents a substantial leap forward in the analysis of social policies By supplementing theory with applied research examples this important new book makes the case for enhancing the scope and relevance of social research by combining randomized experiments with non experimental statistical methods and it serves as a useful guide for researchers who wish to do so
