Remembering Fergus Craik, 2021-06-10 Memory is typically thought of as a set of neural representations memory traces that must be found and reactivated in order to be experienced It is often suggested that memory traces are represented by a hierarchically organized system of analyzers modified sharpened and differentiated by encounters with successive events *Remembering* An activity of mind and brain is the magnum opus of one of the leading figures in the psychology of memory It sets out Fergus Craik's current view of human memory as a dynamic activity of mind

and brain The author argues that remembering should be understood as a system of active cognitive processes similar to perhaps identical to the processes underlying attending perceiving and thinking Thus encoding processes are essentially viewed as the mental activities involved in perceiving and understanding and retrieval is described as the partial reactivation of these same processes This account proposes that episodic and semantic memory should be thought of as levels in a continuum of specificity rather than as separate systems of memory In addition the book presents Craik s views on working memory and on age related memory impairments In the latter case the losses are attributed largely to a difficulty with the self initiation of appropriate encoding and retrieval operations compensated when needed by support from the external environment The development of these ideas is discussed throughout the book and illustrated substantially by experiments from the author s lab but also by empirical and theoretical contributions from other researchers A broad account of current ideas and findings in contemporary memory research but viewed from the author s personal theoretical standpoint

Remembering An activity of mind and brain will be essential for researchers graduate and postdoctoral students working in the field of human memory
