Smart Consumers Of Questions:

The Smart Consumer's Book of Questions Linda Mack Ross, 1996 A consumer guide providing the questions to ask and the process to follow for making the best choices when hiring a service provider or purchasing a product *Smart consumers in the internet of energy* Monica Giulietti, Chloé Le Coq, Bert Willems, Karim Anaya, 2019-11-19 This report analyses international case studies of innovative business models and regulatory arrangements and provides recommendations for a truly smart energy system Active consumers who have access to distributed energy resources such as solar photovoltaics storage electric vehicles and heating appliances will play a crucial role in the challenging transition to a low carbon energy system explains Monica Giulietti one of the report's authors For fairer prices use tariffs based on capacity rather than on volume The current network tariff regime is not optimal for a smart energy system Researchers recommend that tariffs be more directly linked to costs A more advanced tariff structure is feasible in a smart electricity network tariffs can be dependent on time and location and adapt to local network congestion A shift towards tariffs based on capacity will also reduce the subsidisation of the energy system by poorer consumers to the richer ones thereby improving the fairness of the tariff structure says Bert Willems co author of the report The DSO TSO interaction models are to be enhanced The report highlights different proposals for DSO TSO interactions that allow the trade of flexible services provided by distributed energy resources under different regulatory and market contexts in the United Kingdom Australia New York and Europe While we've observed that in all cases an expansion of the DSO's roles capabilities and coordination with the TSO is required our analysis also shows that most jurisdictions have not yet identified their preferred organisational set up The European Commission should systematically take into account the differences of Member States such as the number size and independence of DSOs in future studies or impact assessments says Karim Anaya co author of the study Both price and non price factors are required for consumers to engage Bringing together smart meter technology blockchain and apps can help consumers to take part in energy transactions by informing them about the advantages provided by distributed energy resources at a given time However these technologies can only help if the costs for consumers are low Otherwise non price factors such as climate activism or environmental preferences will be the sole drivers for consumers to participate in this system Although financial benefits only cannot motivate consumers engagement in a complex system they are significant signals And we need strong signals if we want consumers to modify longstanding habits Going off grid the risk of death spiral The authors warn that in the long run when the costs of storage and local generation are expected to drop local energy communities might decide to disconnect from the distribution network and operate on a stand alone basis The cost of the distribution network will then have to be covered by the remaining network users who as a result will see their energy bills increase This could lead to a death spiral where more customers leave the distribution network though unlikely in northern Europe making these obsolete Networks would go bankrupt and only small island grids would remain Smart consumers are

highly dependent on the ecosystem they are operating in We can learn from international experiences that Europe needs to develop innovative regulatory models and be ready to test new institutional schemes that involve consumers to support the energy transition The work ahead goes beyond monitoring what the Clean Energy Package can deliver we have to anticipate new trends and take action to give more clarity to what DSOs and TSOs can do together and avoid new bottlenecks concludes Chlo Le Coq
