

PSYCHOLOGY 2301 STUDY GUIDE

CHAPTER 12 Personality

What is psychoanalysis and who was its founder?

Psychoanalysis is the techniques used in treating psychological disorders by seeking to expose and interpret unconscious tensions, and it was founded by Sigmund Freud.

According to Sigmund Freud, the three structures of the personality include the id, the ego, and the superego. Know the definitions of each.

- ID- a reservoir of unconscious psychic energy that strives to satisfy basic sexual and aggressive drives (pleasure principle)
- Ego- the largely conscious, "executive" part of personality that balances the demands of the id, superego, and reality (reality principle)
- Superego- the part of the personality that represents internalized ideals and provides standards for judgment and for future goals (conscience)

Freud used an iceberg metaphor to depict his view that most of the mind is unconscious; therefore, the focus of psychology should be on the unconscious. (See the depiction of the iceberg idea in your text.)

The preconscious exists just below the surface of the water. You can see the murky shape and outline of the submerged ice if you focus and make an effort to see it. Like the unconscious mind, Freud believed that the preconscious could have an influence on conscious awareness.

What are the five stages of Freud's psychosexual stage theory? Know them in order.

1. Oral (0-18 months)- pleasure centers on the mouth; sucking, biting, and chewing
2. Anal (18-36 months)- pleasure focuses on bowel and bladder elimination; coping with demands for control
3. Phallic (3-6 years)- pleasure zone is the genitals; coping with incestuous sexual feelings
4. Latency (6 to puberty)- a phase of dormant sexual feelings
5. Genital (puberty on)- maturation of sexual interests

Definition of defense mechanisms.

In psychoanalytic theory, the ego's protective methods of reducing anxiety by unconsciously distorting reality.

What is reaction formation, projection, regression, repression, rationalization and displacement? (be able to identify an example of each)

- Reaction Formation- a defense mechanism in which emotions and impulses which are anxiety-producing or perceived to be unacceptable are mastered by exaggeration of the directly opposing tendency

Example: A gay person who is heterosexually promiscuous may be concealing their homosexual reality.

- Projection- a defense mechanism in which the human ego defends itself against unconscious impulses or qualities by denying their existence in themselves while attributing them to others

Example: A bully may project their own feelings of vulnerability onto the target.

- Regression- a defense mechanism leading to the temporary or long-term reversion of the ego to an earlier stage of development rather than handling unacceptable impulses in a more adaptive way

Example: A woman gets in an argument with someone at work and starts sobbing uncontrollably.

- Repression- attempt to direct one's own desires and impulses toward pleasurable instincts by excluding them from one's consciousness and holding or subduing them in the unconscious

Example: A child suffers abuse by a parent, represses the memories, and becomes completely unaware of them as a young adult.

- Rationalization- a defense mechanism in which controversial behaviors or feelings are justified and explained in a seemingly rational or logical manner to avoid the true explanation

Example: A person might account for a bad mood or general rude behavior by explaining that bad traffic affected the morning commute.

- Displacement- an unconscious defense mechanism whereby the mind substitutes either a new aim or a new object for goals felt in their original form to be dangerous or unacceptable

Example: A person who becomes angry at her professor may come home and take her anger out on her spouse.

What is the definition of a projective test? (provide examples of proj. tests)
