Studying Insects Experiences In Science:

Aesthetic Experience in Science Education Per-Olof Wickman, 2006-04-21 This book examines the role of aesthetic experience in learning science and in science education from the perspective of knowledge as action and language use. The theoretical underpinnings are based on the writings of John Dewey and Ludwig Wittgenstein. In their spirit, aesthetics is examined as it appears in the lives of people and how it relates to the activities in which they are involved. Centered around an empirical analysis of how students and their teachers use aesthetic language and acts during laboratory and field work, the book demonstrates that aesthetics is something that is constantly talked about in science class and that these aesthetic experiences are intimately involved in learning science. These empirical findings are related to current debates about the relation between aesthetics and science and about motivation, participation, learning, and socio-cultural issues in science education. This book features an empirical demonstration of the importance and specific roles of aesthetic experiences in learning science, a novel contribution to the current debate on how to understand motivation, participation, and learning, and a new methodology of studying learning in action. Part I sketches out the theoretical concepts of Wickman's practical epistemology, analysis of the fundamental role of aesthetics in science and science education. Part II develops these concepts through an analysis of the use of aesthetic judgments when students and teachers are talking in university science classes. Part III sums up the general implications of the theoretical underpinnings and empirical findings for teaching and learning science. Here Wickman expands the findings of his study beyond the university setting to K-8 school science and explicates what it would mean to make science education more aesthetically meaningful. Wickman's conclusions deal to a large extent with aesthetic experience as individual transformation and with people's prospects for participation in an activity such as science education. These conclusions have significance beyond science teaching and learning that should be of concern to educators generally. This book is intended for educational researchers, graduate students, and teacher educators in science education internationally, as well as those interested in aesthetics, philosophy of education, discourse analysis, socio-cultural issues, motivation, learning, and meaning-making more generally. A Cultural-Historical Study of Children Learning Science Marilyn Fleer, Niklas Pramling, 2014-10-01 This book moves beyond the traditional constructivist and social constructivist view of learning and development in science. It draws upon cultural-historical theory in order to theorise early childhood science education in relation to our currently globalised education contexts. The book argues that concept development in science for young children can be better theorised by using Vygotsky's concept of Imagination and creativity, Vygotsky's theory of play, and his work on higher mental functions, particularly the concept of inter- and intrapsychological functioning. Key concepts are extracted from the theoretical section of the book and used as categories for analysis in presenting evidence and new ideas in the second section of the book. In this second part of the book, the authors examine how science knowledge has been constructed within particular countries around

the globe where empirical research in early childhood science education has occurred The third part of the book examines the nature of the encounter between the teacher and the child during science learning and teaching In the final part of the book the authors look closely at the range of models and approaches to the teaching of early childhood science that have been made available to early childhood teachers to guide their planning and teaching They conclude the book with a theoretical discussion of the cultural historical foundation for early childhood science education followed by a model of teaching scientific concepts to young children in play based settings including homes and community contexts
