Traditionally many temporary waters be they ponds pools streams or wetlands have been considered to be wasted areas of land potentially convertible to agriculture once drained In reality they are natural features of the global landscape that represent distinct and unique habitats for many species some that are found nowhere else and others that reach their maximum abundance and or genetic diversity there Temporary waters are also very important from a human health perspective since they function as breeding places for the vectors of many disease organisms including those that spread malaria schistosomiasis yellow fever and dengue Most of these exact a high toll in terms of global human suffering and reduced regional economies This book collates and synthesises the highly scattered and diverse global literature on pure and applied aspects of these habitats and their biota It examines the ecology of temporary waters in both natural and human environments and seeks to identify common evolutionary themes It will be of particular interest to aquatic ecologists invertebrate and vertebrate biologists environmental biologists wetland managers and conservationists those charged with controlling water associated diseases entomologists educators and natural historians
