

# RED BLOOD CELLS

**Red blood cells**, also known as erythrocytes, are cells in the bloodstream that are responsible for carrying oxygen from the lungs to the body's tissues and removing carbon dioxide from those tissues to be exhaled.

They contain a protein called hemoglobin that binds to oxygen and helps transport it throughout the body. Red blood cells are produced in the bone marrow and have a unique shape that allows them to flow smoothly through blood vessels. Their function is essential to maintaining proper oxygen levels and overall health.

Ralph L. Plasmar,2004 Sickle cell anaemia is an inherited blood disorder characterised primarily by chronic anaemia and periodic episodes of pain and occurring in approximately 1 in every 400 African American infants born in the United States each year Individuals of Mediterranean Arabian Caribbean South and Central American and East Indian ancestry can also be affected The underlying problem involves haemoglobin a component of the red cells in the blood The haemoglobin molecules in each red blood cell carry oxygen from the lungs to the body organs and tissues and bring back carbon dioxide to the lungs In sickle cell anaemia the haemoglobin is defective After the haemoglobin molecules give up their oxygen some of them may cluster together and form long rod like structures These structures cause the red blood cells to become stiff and to assume a sickle shape Unlike normal red cells which are usually smooth and donut shaped the sickled red cells cannot squeeze through small blood vessels Instead they stack up and cause blockages that deprive the organs and tissue of oxygen carrying blood This process produces the periodic episodes of pain and ultimately can damage the tissues and vital organs and lead to other serious medical problems Unlike normal red blood cells which last about 120 days in the bloodstream sickled red cells die

after only about 10 to 20 days Because they cannot be replaced fast enough the blood is chronically short of red blood cells a condition called anaemia Sickle cell anaemia is caused by an error in the gene that tells the body how to make haemoglobin The defective gene tells the body to make the abnormal haemoglobin that results in deformed red blood cells This book gathers the latest research in this important field      **Aquatic Ecotoxicology** Alain Boudou, 2018-01-10 Research into

ecotoxicology can be classified into three fundamental concerns abiotic factors which characterize the physicochemistry of environments biotic factors relating to biological structures and functions and contamination factors which define the modes of pollution of ecosystems The most significant research methodologies currently being developed in aquatic ecotoxicology are presented specifically experimental approaches in the laboratory      **Oxidative Stress** Helmut Sies, 2013-10-22

Oxidative Stress is intended as an in depth account of knowledge and problems in the field of oxygen related damage in biological systems The topics range from an assessment of molecular events in in vitro model systems to complex problems in clinical medicine Organized into two parts with a total of 18 chapters this book begins with an introduction to oxidative stress elucidating specific topics on reactive oxygen species detoxification system and nature of oxidative damage The first part focuses on models used with cells and tissues in the study of oxidative stress whereas the second part describes the processes elicited by oxidative stress      *Pathobiology of Cell Membranes* Benjamin F. *Pathobiology of Cell Membranes* Volume II is the second in a multivolume treatise on pathobiological aspects of cell membranes that aims to give the reader an overview of developments concerning the role of altered cell membranes in various pathological processes This volume includes not only information on pathobiological aspects of cell membranes as studied at the molecular and subcellular level but also important new advances in the role of membranes in human diseases such as multiple sclerosis shock lung muscle dystrophies and hematological disorders The book begins by discussing a very important and yet poorly known aspect of cellular metabolism namely the compartmentalization of intracellular cations such as sodium calcium and magnesium This is followed by separate chapters on fundamentals of membrane conformational changes in the erythrocyte model the structure and function of peroxisomes and their role in disease processes the use of invertebrate models for studies of pathological reactions and reactions of lysosomes to cellular injury Subsequent chapters deal with the pathology of skeletal muscle membranes the shock lung syndrome cellular mechanisms involved in jaundice and cholestasis and pathology of the endothelium      **Environmental Oxidants** Jerome O.
