Sintering Densification Grain Growth And Microstructure:

Sintering Suk-Joong L. Kang, 2004-11-27 Sintering is the process of forming materials and components from a powder under the action of thermal energy. It is a key materials science subject. Most ceramic materials and many specialist metal powder products for use in key industries such as electronics, automotive and aerospace are formed this way. Written by one of the leading experts in the field, this book offers an unrivalled introduction to sintering and sintering processes for students of materials science and engineering and practicing engineers in industry. The book is unique in providing a complete grounding in the principles of sintering and equal coverage of the three key sintering processes: densification, grain growth and microstructure. Students and professional engineers alike will be attracted by the emphasis on developing a detailed understanding of the theory and practical processes of sintering, the balanced coverage of ceramic and metal sintering and the accompanying examination questions with selected solutions. Delivering unrivalled depth of coverage on the basis of sintering science including thermodynamics and polycrystalline microstructure. Unique in its balanced coverage of the three key sintering elements: densification, grain growth and microstructure. A key reference for students and engineers in materials science and engineering accompanied by examination questions and selected solutions. Microstructural Design of Advanced Engineering Materials Dmitri A. Molodov, 2013-07-17 The choice of a material for a certain application is made taking into account its properties. If, for example, one would like to produce a table, a hard material is needed to guarantee the stability of the product, but the material should not be too hard so that manufacturing is still as easy as possible. In this simple example, wood might be the material of choice. When coming to more advanced applications, the required properties are becoming more complex and the manufacturer's desire is to tailor the properties of the material to fit the needs. To let this dream come true, insights into the microstructure of materials are crucial to finally control the properties of the materials because the microstructure determines its properties. Written by leading scientists in the field of microstructural design of engineering materials, this book focuses on the evolution and behavior of granular microstructures of various advanced materials during plastic deformation and treatment at elevated temperatures. These topics provide essential background and practical information for materials scientists, metallurgists and solid state physicists. **Advances in Sintering Science and Technology II** Suk-Joong L. Kang, Rajendra Bordia, Eugene A. Olevsky, Didier Bouvard, 2012-09-19 This publication provides an excellent one-stop resource for understanding the most important current issues in the research and advances in sintering science and technology. **Sintering of Advanced Materials** Zhigang Zak Fang, 2010-09-27 Sintering is a method for manufacturing components from ceramic or metal powders by heating the powder until the particles adhere to form the component required. The resulting products are characterised by an enhanced density and strength and are used in a wide range of industries.
