Johnson, 2013-10-28 This book represents a collection of 30 selected papers from the work of John W Cahn Dr Cahn is Senior Fellow at the Materials Science and Engineering Laboratory of the National Institute of Standards and Technology and is widely recognized as a

founder of modern theory and thought in materials science The range of his research included kinetics and mechanisms of metallurgical phase changes surfaces interfaces defects quasicrystals thermodynamics and other areas impacting the fundamental understanding of materials science Each paper includes a 2-4 page review of the impact and historical perspective of the work This is an important collection for students instructors and scientists interested in materials science

Natural Focusing and Fine Structure of Light J.F Nye,1999-01-01 A new kind of optics has grown up during the last 25 years Geometrical optics has been studied for centuries the law of reflection was known to the ancient Greeks and wave optics heralded by Huygens Treatise on Light has been studied for more than 300 years But in the mid 1970s it began to be understood that when natural processes focus light as when sunlight is reflected from the sea at sunset the light caustics that are produced have a systematic behavior previously unrecognized Natural Focusing and Fine Structure of Light Caustics and Wave Dislocations provides a definitive account of how classical optics has been reconstructed in a modern way by emphasizing the hierarchy of singularities that exists in light fields The book discusses the singularities of geometrical optics and their systematization by catastrophe theory It explores the diffraction patterns associated with caustics that are dominated by wave dislocations line singularities of the phase and analogous to crystal dislocations The book is a perfect blend of mathematics and physics combining theory computer simulation and beautiful experimental photographs of the phenomena studied

Visual Differential Geometry and Forms Tristan Needham,2021-07-13 An inviting intuitive and visual exploration of differential geometry and forms Visual Differential Geometry and Forms fulfills two principal goals In the first four acts Tristan Needham puts the geometry back into differential geometry Using 235 hand drawn diagrams Needham deploys Newton's geometrical methods to provide geometrical explanations of the classical results In the fifth act he offers the first undergraduate introduction to differential forms that treats advanced topics in an intuitive and geometrical manner Unique features of the first four acts include four distinct geometrical proofs of the fundamentally important Global Gauss Bonnet theorem providing a stunning link between local geometry and global topology a simple geometrical proof of Gauss's famous Theorema Egregium a complete geometrical treatment of the Riemann curvature tensor of an n manifold and a detailed geometrical treatment of Einstein's field equation describing gravity as curved spacetime General Relativity together with its implications for gravitational waves black holes and cosmology The final act elucidates such topics as the unification of all the integral theorems of vector calculus the elegant reformulation of Maxwell's equations of electromagnetism in terms of 2-forms de Rham cohomology differential geometry via Cartan's method of moving frames and the calculation of the Riemann tensor using curvature 2-forms Six of the seven chapters of Act V can be read completely independently from the rest of the book Requiring only basic calculus and geometry Visual Differential Geometry and Forms provocatively rethinks the way this important area of mathematics should be considered and taught

Mathematical Research in Materials Science National Research Council,Division on Engineering and Physical Sciences,Commission on

Physical Sciences, Mathematics, and Applications, Committee on Mathematical Sciences Applied to Materials Science, 1993-02-01 This book describes fruitful past collaborations between the mathematical and materials sciences and indicates future challenges It seeks both to encourage mathematical sciences research that will complement vital research in materials science and to raise awareness of the value of quantitative methods The volume encourages both communities to increase cross disciplinary collaborations emphasizing that each has much to gain from such an increase and it presents recommendations for facilitating such work This book is written for both mathematical and materials science researchers interested in advancing research at this interface for federal and state agency representatives interested in encouraging such collaborations and for anyone wanting information on how such cross disciplinary collaborative efforts can be accomplished successfully

Geometric Phases in Classical and Quantum Mechanics Dariusz Chruscinski, Andrzej Jamiolkowski, 2012-12-06 Several well established geometric and topological methods are used in this work in an application to a beautiful physical phenomenon known as the geometric phase This book examines the geometric phase bringing together different physical phenomena under a unified mathematical scheme The material is presented so that graduate students and researchers in applied mathematics and physics with an understanding of classical and quantum mechanics can handle the text

Ice Physics and the Natural Environment John S. Wettlaufer, J. Gregory Dash, Norbert Untersteiner, 2013-06-29 The Advanced Study Institute Ice Physics in the Natural and Endangered Environment was held at Acquafredda di Maratea Italy from September 7 to 19 1997 The ASI was designed to study the broad range of ice science and technology and it brought together an appropriately interdisciplinary group of lecturers and students to study the many facets of the subject The talks and poster presentations explored how basic molecular physics of ice have important environmental consequences and conversely how natural phenomena present new questions for fundamental study The of lectures discusses these linkages in order that overall unity of following summary the subject and this volume can be perceived Not all of the lecturers and participants were able to contribute a written piece but their active involvement was crucial to the success of the Institute and thereby influenced the content of the volume We began the Institute by retracing the history of the search for a microscopic understanding of melting Our motivation was straightforward Nearly every phenomenon involving ice in the environment is influenced by the change of phase from solid to liquid or vice versa Hence a sufficiently deep physical picture of the melting transition enriches our appreciation of a vast array of geophysical and technical problems

Nonlinear Partial Differential Equations Gui-Qiang Chen, Emmanuele DiBenedetto, 1999 This volume is a collection of original research papers and expository articles stemming from the scientific program of the Nonlinear PDE Emphasis Year held at Northwestern University Evanston IL in March 1998 The book offers a cross section of the most significant recent advances and current trends and directions in nonlinear partial differential equations and related topics The book's contributions offer two perspectives There are papers on general analytical treatment of the theory and papers on

computational methods and applications originating from significant realistic mathematical models of natural phenomena Also included are articles that bridge the gap between these two perspectives seeking synergistic links between theory and modeling and computation The volume offers direct insight into recent trends in PDEs This volume is also available on the Web Those who purchase the print edition can gain free access by going to www.ams.org/conm Kinetics of Materials Robert W. Balluffi, Samuel M. Allen, W. Craig Carter, 2005-12-07 KINETICS OF MATERIALS A CLASSROOM TESTED TEXTBOOK PROVIDING A FUNDAMENTAL UNDERSTANDING OF BASIC KINETIC PROCESSES IN MATERIALS This textbook reflecting the hands on teaching experience of its three authors evolved from Massachusetts Institute of Technology's first year graduate curriculum in the Department of Materials Science and Engineering It discusses key topics collectively representing the basic kinetic processes that cause changes in the size shape composition and atomistic structure of materials Readers gain a deeper understanding of these kinetic processes and of the properties and applications of materials Topics are introduced in a logical order enabling students to develop a solid foundation before advancing to more sophisticated topics Kinetics of Materials begins with diffusion offering a description of the elementary manner in which atoms and molecules move around in solids and liquids Next the more complex motion of dislocations and interfaces is addressed Finally still more complex kinetic phenomena such as morphological evolution and phase transformations are treated Throughout the textbook readers are instilled with an appreciation of the subjects analytic foundations and in many cases the approximations commonly used in the field The authors offer many extensive derivations of important results to help illuminate their origins While the principal focus is on kinetic phenomena in crystalline materials select phenomena in noncrystalline materials are also discussed In many cases the principles involved apply to all materials Exercises with accompanying solutions are provided throughout Kinetics of Materials enabling readers to put their newfound knowledge into practice In addition bibliographies are offered with each chapter helping readers to investigate specialized topics in greater detail Several appendices presenting important background material are also included With its unique range of topics progressive structure and extensive exercises this classroom tested textbook provides an enriching learning experience for first year graduate students Polymer Crystallization Günter Reiter, Jens-Uwe Sommer, 2008-01-11 The classical view on polymer crystallization basically focused on the explanation of a few macroscopically observable parameters like the thickness of the resulting lamellar structure and the corresponding growth rates However the emerging paradigm for the description of chain crystals is too simple and cannot account for the complex non equilibrium processes responsible for structure formation on various levels ranging from the nanometer up to the millimeter scale This complexity detected by several novel experimental results led to a renewed interest in this old topic of polymer crystallization These new findings concern the early stages of the crystallization process crystal formation in confined geometries like ultra thin films and the competition between micro phase separation and crystallization in copolymers and blends In particular high spatial resolution

techniques such as atomic force microscopy provided deeper insight into the molecular organization of crystallizable polymers Computer simulations based on microscopic processes were used to improve our understanding of how polymer crystals are nucleated and how they grow New ideas emerged about possible multistage pathways which are followed during the formation of polymer lamellae The importance and the consequences of the non equilibrium character of polymer crystals got significantly more attention Links and analogies to growth phenomena and pattern formation in general are being developed However these ideas are still subject of intensive and controversial discussions

The Coming of Materials Science R.W. Cahn, 2001-03-16 The Coming of Materials Science both covers the discipline of materials science and draws an impressionistic map of the present state of the subject The first chapter examines the emergence of the materials science concept in both academe and industry The second and third chapters delve back into the prehistory of materials science examining the growth of such concepts as atoms crystals and thermodynamics and also examine the evolution of a number of neighbouring disciplines to see what helpful parallels might emerge The book contains numerous literature references Many refer to the earliest key papers and books while others are to sources often books offering a view of the present state of a topic Early references are to the past but as the book continues it brings the reader up to date with more recent sources The author Professor Robert Cahn FRS has striven to be critical about the history of the discipline of materials science and to draw general conclusions about scientific practice from what he has discovered about the evolution of materials science Further issues that the book highlights include What is a scientific discipline How do disciplines merge and differentiate Can a discipline also be interdisciplinary Is materials science a real discipline A large range of themes is presented in the book and readers are invited to interact with the author if they reach alternative conclusions This book is not just for reading and reference but exists to stimulate thought and provoke discussion as well
