Species Diversity In Ecological Communities Historical And Geographical Perspectives:

Species Diversity in Ecological Communities Robert E. Ricklefs, Dolph Schluter, 1993 A pioneering work Species Diversity in Ecological Communities looks at biodiversity in its broadest geographical and historical contexts For many decades ecologists have studied only small areas over short time spans in the belief that diversity is regulated by local ecological interactions However to understand fully how communities come to have the diversity they do and to properly address urgent conservation problems scientists must consider global patterns of species richness and the historical events that shape both regional and local communities The authors use new theoretical developments analyses and case studies to explore the large scale mechanisms that generate and maintain diversity Case studies of various regions and organisms consider how local and regional processes interact to determine patterns of species richness The contributors emphasize the fact that ecological processes acting quickly on a local scale do not erase the effects of regional and historical events that occur more slowly and less frequently This book compels scientists to rethink the foundations of community ecology and sets the stage for further research using comparative experimental geographical and historical data **The Theory of**

Ecological Communities Mark Vellend, 2020-09-15 A plethora of different theories models and concepts make up the field of community ecology Amid this vast body of work is it possible to build one general theory of ecological communities What other scientific areas might serve as a guiding framework As it turns out the core focus of community ecology understanding patterns of diversity and composition of biological variants across space and time is shared by evolutionary biology and its very coherent conceptual framework population genetics theory The Theory of Ecological Communities takes this as a starting point to pull together community ecology's various perspectives into a more unified whole Mark Vellend builds a theory of ecological communities based on four overarching processes selection among species drift dispersal and speciation These are analogues of the four central processes in population genetics theory selection within species drift gene flow and mutation and together they subsume almost all of the many dozens of more specific models built to describe the dynamics of communities of interacting species The result is a theory that allows the effects of many low level processes such as competition facilitation predation disturbance stress succession colonization and local extinction to be understood as the underpinnings of high level processes with widely applicable consequences for ecological communities Reframing the numerous existing ideas in community ecology The Theory of Ecological Communities provides a new way for thinking about biological composition and diversity *Assessment of Biodiversity for Improved Forest Planning* Peter Bachmann, Michael Köhl, Risto Päivinen, 2013-04-17

The Global Biodiversity Strategy signed in 1992 in Rio de Janeiro and the resolutions at the Ministerial Conferences on the Protection of Forests in Europe in Strasbourg 1990 and Helsinki 1993 commit the signatory states to monitor nationally the state of biodiversity and to sustain the characteristic natural variation in the country Sustainability and long term planning are the two terms best describing the philosophy of traditional forest management

practices However the traditional planning techniques are not primarily developed to maintain sustainability of biodiversity The gap between the international commitments and the practices in forest assessment and management is obvious This publication presents experience in methodology for assessing and monitoring the variation of ecosystems and habitats in relation to biodiversity conservation and for integrating biodiversity in regional planning of forest management and land use The state of the art in the field of natural resource assessments with special reference to forest biodiversity is reviewed progress in integrating data on biodiversity in forest management planning is presented and the information needs regarding biodiversity conservation and the question to what degree assessment methods for forest biodiversity can be simplified for practical applications are discussed The book is intended for researchers and practitioners in the field of forest and environmental planning and environmental policies Contribuciones mastozoológicas en homenaje a Bernardo Villa Víctor Sánchez-Cordero, Rodrigo A. Medellín, 2005 **Vegetation Ecology** Eddy van der Maarel, Janet Franklin, 2013-01-14 Additional resources for this book can be found at <http://www.wiley.com/go/vandermaarelfranklin/vegetationecology> Vegetation Ecology 2nd Edition is a comprehensive integrated account of plant communities and their environments Written by leading experts in their field from four continents the second edition of this book covers the composition structure ecology dynamics diversity biotic interactions and distribution of plant communities with an emphasis on functional adaptations reviews modern developments in vegetation ecology in a historical perspective presents a coherent view on vegetation ecology while integrating population ecology dispersal biology soil biology ecosystem ecology and global change studies tackles applied aspects of vegetation ecology including management of communities and invasive species includes new chapters addressing the classification and mapping of vegetation and the significance of plant functional types Vegetation Ecology 2nd Edition is aimed at advanced undergraduates graduates and researchers and teachers in plant ecology geography forestry and nature conservation Vegetation Ecology takes an integrated multidisciplinary approach and will be welcomed as an essential reference for plant ecologists the world over **Biodiversity Dynamics** Michael L. McKinney, James A. Drake, 2001-04-12 How will patterns of human interaction with the earth's ecosystem impact on biodiversity loss over the long term not in the next ten or even fifty years but on the vast temporal scale be dealt with by earth scientists This volume brings together data from population biology community ecology comparative biology and paleontology to answer this question The SAGE Handbook of Biogeography Andrew Millington, Mark Blumler, Udo Schickhoff, 2011-09-22 A superb resource for understanding the diversity of the modern discipline of biogeography and its history and future especially within geography departments I expect to refer to it often Professor Sally Horn University of Tennessee As you browse through this fine book you will be struck by the diverse topics that biogeographers investigate and the many research methods they use Biogeography is interdisciplinary and a commonly voiced concern is that one biogeographer may not readily understand another's research findings A handbook like this is important for synthesising

situating explaining and evaluating a large literature and pointing the reader to informative publications Geographical Research A valuable contribution in both a research and teaching context If you are biologically trained it provides an extensive look into the geographical tradition of biogeography covering some topics that may be less familiar to those with an evolution ecology background Alternatively if you are a geography student researcher or lecturer it will provide a useful reference and will be invaluable to the non biogeographer who suddenly has the teaching of an introductory biogeography course thrust upon them Adam C Algar *Frontiers of Biogeography* The SAGE Handbook of Biogeography is a manual for scoping the past present and future of biogeography that enable readers to consider where relevant how similar biogeographical issues are tackled by researchers in different schools In line with the concept of all SAGE Handbooks this is a retrospective and prospective overview of biogeography that will Consider the main areas of biogeography researched by geographers Detail a global perspective by incorporating the work of different schools of biogeographers Ecplore the divergent evolution of biogeography as a discipline and consider how this diversity can be harnessed Examine the interdisciplinary debates that biogeographers are contributing to within geography and the biological sciences Aimed at an international audience of research students academics researchers and practitioners in biogeography the text will attract interest from environmental scientists ecologists biologists and geographers alike

Metacommunities Marcel Holyoak, Mathew A. Leibold, Robert D. Holt, 2005-10 Takes the hallmarks of metapopulation theory to the next level by considering a group of communities each of which may contain numerous populations connected by species interactions within communities and the movement of individuals between communities This book seeks to understand how communities work in fragmented landscapes

Community Ecology Gary George Mittelbach, Brian J. McGill, 2019 Community ecology has undergone a transformation in recent years from a discipline largely focused on processes occurring within a local area to a discipline encompassing a much richer domain of study including the linkages between communities separated in space metacommunity dynamics niche and neutral theory the interplay between ecology and evolution eco evolutionary dynamics and the influence of historical and regional processes in shaping patterns of biodiversity To fully understand these new developments however students continue to need a strong foundation in the study of species interactions and how these interactions are assembled into food webs and other ecological networks This new edition fulfils the book s original aims both as a much needed up to date and accessible introduction to modern community ecology and in identifying the important questions that are yet to be answered This research driven textbook introduces state of the art community ecology to a new generation of students adopting reasoned and balanced perspectives on as yet unresolved issues Community Ecology is suitable for advanced undergraduates graduate students and researchers seeking a broad up to date coverage of ecological concepts at the community level

Microbial Communities Heribert Insam, Andrea Rangger, 2013-06-29 Research on decomposer communities of terrestrial ecosystems for a long time has focussed on microbial biomass and gross turnover

parameters Recently more and more attempts are made to look beyond the biomass and more specifically determine functions and populations on a smaller scale in time and space A multitude of techniques is being improved and developed Garland and Mills 1991 triggered a series of publications on substrate utilization tests in the field of microbial ecology Despite several promising results for different applications in different laboratories many problems concerning the assay and the interpretation of results became evident After individual discussions on the approach with colleagues from various laboratories we started to plan a workshop on the matter The response on our first circular was extraordinary and instead of a small workshop it became a meeting with almost 150 participants The meeting was named Substrate use for characterization of microbial communities in terrestrial ecosystems SUBMECO and was held in Innsbruck Austria from Oct 16-18 1996 The very focussed scope attracted enthusiastic advocates of the approach and also serious critics Some of the topics concerned improvements of current inoculation and incubation techniques ranging from sample pre treatment inoculum density and incubation temperature to statistical data handling New methods for calculating microbial diversity were proposed as well as bootstrap methods that allow statistics with many variables on a relatively low number of replicates
