This well-illustrated text presents a rational approach to the preparation and photography of pathological specimens and discusses the many facets involved including photography room design, camera, film, backgrounds, rulers and labels, and photographic techniques such as lighting, control of specular highlights, focusing, framing, proportioning, and standardizing exposure. One particular section is devoted to dissection techniques of organ systems and the best way to dissect and display lesions. Methods of color restoration and color preservation are described; equipment, backgrounds and technique for cadaver and clinical photography are also discussed. This invaluable text will be essential reading for anyone photographing biological specimens—gross or clinical. Although the specimens are those of veterinary pathology, the techniques are directly applicable to a wide variety of biological material.
