Subcellular Particles Structures And Organelles:

Subcellular Particles, Structures, and Organelles Jerold A. Last, **Methods in Membrane Biology** Edward D.

Korn, 2012-12-06 Volume 3 continues the approach carried out in the first two volumes of this series of publishing articles on membrane methodology which include in addition to procedural details incisive discussions of the applications of the methods and of their limitations What is the theoretical basis of the method how and to what problems can it be applied how does one interpret the results what has thus far been achieved by the method what lies in the future these are the questions the authors have tried to answer No area of membrane biology engages the interest of more investigators than studies of the plasma membrane Four chapters in this volume are concerned with one or more aspects of the cell surface Fundamental to all studies of the cell surface are the isolation and characterization of pure plasma membranes Many preparations described in the literature are inadequate or are inadequately characterized In the first chapter Neville discusses the theoretical and practical bases of tissue fractionation emphasizes the variations in enzyme content among plasma membranes from different sources offers guidance in the choice of the proper criteria for assessing membrane purity and suggests the best markers for detecting the possible presence of contaminating organelles To review in detail each of the many preparations of plasma membranes that have been published is impossible **Biology of Tumors: Surfaces, Immunology, and Comparative**

Pathology Frederick Becker, 2013-04-17 As was shown in the first two volumes of this series great strides have been made in identifying many of the agents or classes of substances responsible for carcinogenesis and in delineating their interactions with the cell Clearly the aim of such studies is that once identified these agents can be eliminated from the environment Yet despite these advances and the elimination of some important carcinogenic agents one major problem exists It is a constant monitor of all oncologic study and diminishes the importance of every experiment and of every clinical observation As we noted earlier that problem is our inability to define the malignant cell It is through studies of the fundamental biology of tumors that we seek this definition A vast amount of information has been gathered which describes what this cell does and to a lesser extent how it does it But the why evades us We have been unable to define the malignant cell save in broad terms by comparing it to its normal counterpart The major problem appears to be that the malignant cell does so much It is a chimera mystifyingly composed of normal activities and structures of phenotypic schizophrenia with embryonic fetal and adult characteristics and occasionally a hint of an unclassifiable capacity unique to malignant cells **Endocytic**

Components: Identification and Characterization J.J.M. Bergeron, J. Robin Harris, 2013-11-11 In step with the rapid growth of research into the biochemical and functional characterization of the endosome Volume 19 surveys the recent advances in the methodological aspects of this field Coverage includes the use of free flow electrophoresis to define endosome subpopulations the endosomal compartments in rat hepatocytes the role of endosomes in transmembrane signalling and six additional articles **National Library of Medicine Current Catalog** National Library of Medicine

type II diabetes are extremely exciting and essential since we hope to one day prevent the disease using gene therapy. These aspects are covered in Molecular Biology of Diabetes I Autoimmunity and Genetics Insulin Synthesis and Secretion. In type II diabetes an abnormality in pancreatic secretion exists concomitantly with peripheral insulin resistance. This abnormality of insulin secretion is believed to be related to a defect in glucose sensing. Uncoupling of glucose sensing from insulin secretion may be the crucial step in the pathogenesis of noninsulin dependent diabetes. In this volume we have invited authors to describe their studies on all known factors affecting cell function including autoimmunity and genetics of diabetes as well as molecular mechanisms of insulin synthesis and secretion. In the last few years the most rapidly advancing area of research in diabetes has been in fact related to insulin action.

Biology of Brain Dysfunction Gerald E. Gaull, 2012-12-06

The growth of neurochemistry molecular biology and biochemical genetics has led to a burgeoning of new information relevant to the pathogenesis of brain dysfunction. This explosion of exciting new information is crying out for collation and meaningful synthesis. In its totality it defies systematic summation and of course no one author can cope. Thus invitations for contributions were given to various experts in areas which are under active investigation of current neurological interest and pregnant. Although this project is relatively comprehensive by dint of size other topics might have been included the selection was solely my responsibility. I believe systematic summation a virtual impossibility indeed hardly worth the effort. The attempt to assemble all of the sections involved in a large treatise with multiple authors inevitably results in untoward delays due to the difference in the rate at which various authors work. Therefore the following strategy has been adopted multiple small volumes and a relatively flexible format with publication in order of receipt and as soon as enough chapters are assembled to make publication practical and economical. In this way the time lag between the ideas and their emergence in print is the shortest.
