Stereoscopic acuity in ocular pursuit of moving objects Matthias Sachsenweger,Ulrich Sachsenweger,2012-12-06 There has been growing acceptance of the insight that the methods so far used in the testing of visual functions have been inadequate when it comes to specific problems and should therefore be supplemented with more specialised methods for dynamic testing As long as two decades ago large scale mass screening produced evidence to the effect that visual acuity so far exclusively determined by means of still samples was not identical with visual acuity in the ocular pursuit of moving targets dynamic visual acuity In other words vision testing can at present provide little information on an individual s capability of identification appreciation and judgement of mobile objects Spatial three dimensional perception of moving targets hereafter referred to as dynamic stereoacuity is the particular subject on which findings are reported in this article Findings of that kind are of considerable relevance to everyday life since many of the phenomena that have to be three dimensionally perceived in private life and in occupational practice are in movement So far dynamic stereoacuity has never been systematically studied and is still a blank space on the maps of ophthalmology and physiology This is equally true for dynamic stereoscopy in binocular vision as well as for perception on the basis of movement parallax a phenomenon of differentiated contour displacement within a given field of vision which is also available to the monocular individual under conditions of head or body or object movement within the visual space **The Key to Sight Testing** Harry L.
