Smith Jr., 2014-09-12 Grasses and grasslands are of increasing interest to conservationists biologists and gardeners There are more than 300 species of native California grasses and they are found in almost every climate from cool wet forests to hot dry deserts Native grasses are also important to land restoration as they improve soil quality increase water infiltration and recycle nutrients Their deep roots can tap soil water which allows them to stay green year round and to act as fire buffers around residences Native grasses also provide vital habitat for many species of insects birds reptiles and mammals Despite their importance grasslands remain one of the most underprotected of California's vegetation types and native grasslands have undergone the greatest percentage loss of any habitat type in the state Grasses are also among the most difficult plants to identify Organized alphabetically Field Guide to Grasses of California covers common native and naturalized grasses and to help identify them also features over 180 color illustrations

Whittaker R.K. Peet, 2012-12-06 R K Peet Dep of Botany University of North Carolina Chapel Hill N C 27514 USA Robert Whittaker's contributions to ecology were many and remarkably varied His publication record will long stand as a monument to his greatness and whatever we do to honor him will likely be rather small in comparison Less well known were his personal interactions and the impact they had on the development of ecology as well as individual scientists Over the years he touched many of us and we felt not just a professional but also a deep personal loss in his passing After his death I was contacted by numerous colleagues who wondered what they might do to honor him Whittaker had long served on the editorial board of *Vegetatio* which prompted Eddy van der Maarel to suggest that a series of papers in the journal might be a fitting memorial and so this project was conceived Whittaker was a master of synthesis and during his career he published numerous review papers which showed clearly how his work related to and built on that of others For this reason it seemed inappropriate and redundant to solicit papers reviewing areas to which Whittaker made important contributions Instead I chose to solicit research papers illustrating current applications of approaches Whittaker developed and showing a few of the recent advances which have grown directly from his pioneering work

Bibliography of Agricultural Bibliographies, 1978      **Bibliographies and Literature of Agriculture**, 1978      *Santa Clara Valley Habitat Plan*, 2010      **New Models for Ecosystem Dynamics and Restoration** Richard J. Hobbs, Katharine N. Suding, Peter Society for Ecological Restoration International, 2013-03-19 As scientific understanding about ecological processes has grown the idea that ecosystem dynamics

are complex nonlinear and often unpredictable has gained prominence Of particular importance is the idea that rather than following an inevitable progression toward an ultimate endpoint some ecosystems may occur in a number of states depending on past and present ecological conditions The emerging idea of restoration thresholds also enables scientists to recognize when ecological systems are likely to recover on their own and when active restoration efforts are needed Conceptual models based on alternative stable states and restoration thresholds can help inform restoration efforts New Models for Ecosystem Dynamics and Restoration brings together leading experts from around the world to explore how conceptual models of ecosystem dynamics can be applied to the recovery of degraded systems and how recent advances in our understanding of ecosystem and landscape dynamics can be translated into conceptual and practical frameworks for restoration In the first part of the book background chapters present and discuss the basic concepts and models and explore the implications of new scientific research on restoration practice The second part considers the dynamics and restoration of different ecosystems ranging from arid lands to grasslands woodlands and savannas to forests and wetlands to production landscapes A summary chapter by the editors discusses the implications of theory and practice of the ideas described in preceding chapters New Models for Ecosystem Dynamics and Restoration aims to widen the scope and increase the application of threshold models by critiquing their application in a wide range of ecosystem types It will also help scientists and restorationists correctly diagnose ecosystem damage identify restoration thresholds and develop corrective methodologies that can overcome such thresholds
