Human Exposure to Pollutants via Dermal Absorption and Inhalation Mihalis Lazaridis, Ian Colbeck, 2010-03-22 Estimates of the air pollution health impact play a crucial role in environmental protection These estimates require accurate data on the pollutant exposure and dose to the population as well as the dose response relationships to calculate the health impact From an air quality manager's perspective there is concern about the validity and accuracy of these calculations There is a need for information and possible ways to adjust the assessment One important topic for air quality managers is to understand the relative contribution of sources to the total exposure These sources may be coming from both different outdoor sources from sectors such as transport industry and energy industries and from a number of indoor sources such as heating ventilation and indoor activities as well as outgassing from building material and furniture Indoor air quality is now drawing the attention of policy makers The basic right to and importance of healthy indoor air was emphasized by the World Health Organization as early as 2000 and several countries have described target concentrations for various pollutants The WHO Air Quality Guidelines 2005 recommended the development of specific guidelines for indoor air quality and these are expected to be published soon Indoor air pollutants have not been as extensively monitored as outdoor air pollutants and the evidence base for contributions to health effects needs to be strengthened **Research Grants Index** National Institutes of Health (U.S.).
