Decision Making under Uncertainty R.W. Scholz, 1983-11-01 This volume contains the revised papers of an international symposium on research on fallacies biases and the development of decision behavior under uncertainty The papers are organized in five main sections The Introduction outlines the conceptual framework and how three of the sections Cognitive Decision Research Social Interaction and Development and Epistemology are interrelated and also how new fields such as research into developmental questions can be productively integrated In the fifth section Comments are collected which evaluate the impact of the contributions on decision research itself and also on cognitive psychology social psychology economic theory and the discipline of mathematics education Small Worlds Warren F. Motte, 1999-01-01 Small Worlds

examines the minimalist trend in French writing from the early 1980s to the present Warren Motte first considers the practice of minimalist in other media such as the plastic arts and music and then proposes a theoretical model of minimalist literature Subsequent chapters are devoted to the work of a variety of contemporary French writers and a diversity of literary genres In his discussion of minimalism Motte considers smallness and simplicity a reduction of means and the resulting amplification of effect immediacy directness clarity repetition symmetry and playfulness He argues that economy of expression offers writers a way of renovating traditional literary forms and allows them to represent human experience more directly Motte provides close readings of novels by distinguished contemporary French writers including Edmond Jabes Annie Ernaux Herve Guibert Marie Redonnet Jean Echenoz Olivier Targowla and Emmanuele Bernheim demonstrating that however diverse their work may otherwise be they have all exploited the principle of formal economy in their writing Warren Motte is a professor of French at the University of Colorado Boulder Playtexts Ludics in Contemporary Literature Nebraska 1995 is his most recent book **The Dimensions of Experience** Andrew P. Smith, 2008-10-30 This book is an evolutionary

history of life on earth Its focus is not the evolution of the structural functional adaptations found in any biology textbook though these are necessarily discussed in a general way Its primarily concerned with consciousness with what the organism experiences Just how far back into evolutionary history consciousness extends of course is a highly controversial issue and one which we will probably never resolve with certainty We know we are conscious and most people would probably extend consciousness to other mammals but when it comes to lower vertebrates let alone invertebrates there is no consensus This book takes a what if approach What if all forms of existence were conscious to some extent a view known as panpsychism or panexperientialism Based on those aspects of their function and behavior that we can actually observe and measure what can we say about what this consciousness is like The resulting story is one in which consciousness becomes increasingly more complex over evolutionary history yet is based on facts of animal behavior that any reader regardless of personal views on consciousness can accept In order to simply a vast amount of scientific literature the book focuses on two general properties of consciousness and its behavioral manifestations the experience of an outer world embedded in space and time and that of

an inner self that is defined by its relationship to other organisms Two key claims made are that 1 dimensions of externally perceived space and time have emerged more or less one at a time over the course of evolutionary history and 2 the number of spatial temporal dimensions experienced by any organism in the outer world is closely related to experienced inner dimensions in its relationships with other organisms For example the simplest invertebrate organisms experience one dimension of space in the form of intensity discriminations made of simple stimuli such as light touch and chemical substances Closely correlated with this one dimensional experience of the outer world is the ability to make simple self other discriminations in which the organism in effect distinguishes itself one dimensionally from the outer world Somewhat more evolved invertebrates such as arthropods experience two dimensions of space their perception being largely limited to shapes contrasts and surfaces They can also distinguish between two dimensions in their relationships with other organisms as exhibited in the ability to discriminate such classes of other as male vs female and kin vs non kin The most highly evolved invertebrates as well as all vertebrates experience additional dimensions of space and or time and make still finer discriminations among other organisms The evolutionary story is not confined to organisms however The book argues that the same kind of dimensional relationships exist on lower levels of existence Thus there are atoms that recognize and interact with other atoms in various degrees of dimensions and there are cells that recognize and interact with other cells in different numbers of dimensions Again the minimal claim being made is that the function and behavior of these lifeforms can be understood in terms of dimensions while leaving it up to individual readers to decide whether this could reflect a similar dimensionality of consciousness Review by Kirkus Discoveries A lucid thought provoking and wide ranging metaphysical treatise by novelist scientific researcher and Stanford Ph D Smith Heralded as the first complete history of consciousness ever written The Dimensions of Experience covers an astonishing

Brain Networks in Aging: Reorganization and Modulation by Interventions Junfeng Sun, Chunbo Li, 2018-02-22 Old adults undertake multiple reduced cognitive abilities in aging which are accompanied with specific brain reorganization in forms of regional brain activity and brain tissues inter region connectivity and topology of whole brain networks in both function and structure The plasticity changes of brain activities in old adults are explained by the mechanisms of compensation and dedifferentiation For example older adults have been observed to have greater usually bilateral prefrontal activities during memory tasks compared to the typical unilateral prefrontal activities in younger adults which was explained as a compensation for the reduced brain activities in visual processing cortices Dedifferentiation is another mechanism to explain that old adults are with much less selective and less distinct activity in task relevant brain regions compared with younger adults A larger number of studies have examined the plasticity changes of brain from the perspective of regional brain activities However studies on only regional brain activities cannot fully elucidate the neural mechanisms of reduced cognitive abilities in aging as multiple regions are integrated together to achieve advanced cognitive function in human brain In recent years brain connectivity network which targets how brain regions are integrated have drawn increasing attention in neuroscience with the development of neuroimaging techniques and graph theoretical analysis Connectivity quantifies functional association or neural fibers between two regions that may be spatially far separated and graph theoretical analysis of brain network examines the complex interactions among multiple regions from the perspective of topology Studies showed that compared to younger adults older adults had altered strength of task relevant functional connectivity between specific brain regions in cognitive tasks and the alternation of connectivity are correlated to behavior performance For example older adults had weaker functional connectivity between the premotor cortex and a region in the left dorsolateral prefrontal cortex in a working memory task Interventions like cognitive training and neuro modulation e.g. transcranial magnetic stimulation have been shown to be promising in regaining or retaining the decreasing cognitive abilities in aging However only few neuroimaging studies have examined the influence of interventions to old adult's brain activity connectivity and cognitive performance This Research Topic calls for contributions on brain network of subjects in normal aging or with age related diseases like mild cognitive impairment and Alzheimer's disease The studies are expected to be based on neuroimaging techniques including but not limited to functional

magnetic resonance imaging Electroencephalography and diffusion tensor imaging and contributions on the influence of interventions to brain networks in aging are highly encouraged All these studies would enrich our understanding of neural mechanisms underlying aging and offer new insights for developing possible interventions to retain cognitive abilities in aging subjects *Advances in Network Complexity* Matthias Dehmer, Abbe Mowshowitz, Frank Emmert-Streib, 2013-06-21 A well balanced overview of mathematical approaches to complex systems ranging from applications in chemistry and ecology to basic research questions on network complexity Matthias Dehmer Abbe Mowshowitz and Frank Emmert Streib well known pioneers in the field have edited this volume with a view to balancing classical and modern approaches to ensure broad coverage of contemporary research problems The book is a valuable addition to the literature and a must have for anyone dealing with network complexity and complexity issues **Why Regions Matter: Small Worlds in Comparative**

Perspective Ailsa Henderson, 2014-06-11 Bringing together experts on regionalism and federalism this collection explores the impact of legislative regions on parties and voters It reflects on the 1980 publication of *Small Worlds* by David Elkins and Richard Simeon which outlined how and why voters and policies differ across Canadian provinces Using recent data the essays in this collection provide a comparative re examination of the impact of regions The book explores attitude divergence in Canada and in the US the role and impact of regional parties in Quebec Scotland and Bavaria the impact of multi level governance on how citizens understand and discharge their duties and the capacity of sub state political systems to influence general political attitudes The result is an empirical and analytical contribution to regionalism and federalism studies that demonstrates how and why regions matter This book was published as a special issue of *Regional and Federal Studies*

West, Paolo Grigolini, To many scientists the gap between the nineteenth century views of consciousness proposed by the psychologist William James and that developed by the inventor of psychophysics Gustav Fechner has never seemed wider However the twentieth century

concept of collective cooperative behavior within the brain has partially reconciled these diverging perspectives suggesting the notion of consciousness as a physical phenomenon A kernel of twenty first century investigators bases their investigations on physiological fluctuations experiments These fluctuations although apparently erratic when analyzed with advanced methods of fractal statistical analysis reveal the emergence of complex behavior intermediate between complete order and total randomness a property usually referred to as temporal complexity Others with the help of modern technologies such MRI establish a more direct analysis of brain dynamics and focus on the brain s topological complexity Consequently the two groups adopt different approaches the former being based on phenomenological and macroscopic considerations and the latter resting on the crucial role of neuron interactions The neurophysiology research work has an increasing overlap with the emerging field of complex networks whereas the behavior psychology experiments have until recently ignored the complex cooperative dynamics that are proved by increasing experimental evidence to characterize the brain function It is crucial to examine both the experimental and theoretical studies that support and those that challenge the view that it is an emergent collective property that allows the healthy brain to function What needs to be discussed are new ways to understand the transport of information through complex networks sharing the same dynamical properties as the brain In addition we need to understand information transfer between complex networks say between the brain and a controlled experimental stimulus Experiments suggest that brain excitation is described by inverse power law distributions and recent studies in network dynamics indicate that this distribution is the result of phase transitions due to neuron network dynamics It is important to stress that the development of dynamic networking establishes a connection between topological and temporal complexity establishing that a scale free distribution of links is generated by the dynamic correlation between dynamic elements located at very large Euclidean distances from one another Dynamic networking and dynamics networks suggest a new way to transfer information the long distance communication through local cooperative interaction It is anticipated that the contributed discussions will clarify how the global intelligence of a complex network emerges from the local cooperation of units and the role played by critical phase transitions in the observed persistence of this cooperation

Language Electrified Mirko Grimaldi, Elvira Brattico, Yury Shtyrov, 2023-09-04 Language as a system we use to communicate represents the brain's biologically perfected machinery for converting thoughts, ideas, concepts and reflections of both the outside world and our inner feelings into words and sentences. Crucially, this process occurs in real time. How hundreds of billions of neurons within the dark of the skull control language and speech remains in some respects a mystery. To track such neural dynamics in time, we need to exploit physiological tools capable of following temporal patterns of neural activity on a fine grain time scale. In parallel, it is necessary to begin to provide a real interdisciplinary academic background for scholars wishing to embark on this field of study. Unlike many similar efforts, this book has been conceived as a hands-on tool offering the reader the possibility to progressively acquire principles, techniques and methods necessary to pursue interdisciplinary research in a fascinating field intersecting linguistic and neuroscience. It focuses on neurophysiological methods and applications useful to track the high speed and rapid temporal dynamics of neural activity involved in language and speech. The chapters in this book are organized into four parts. Part One discusses neural principles and tools for an effective approach to the field of investigation. Part Two looks at the issues and perspectives concerned with the use of a range of neurophysiological technologies to investigate the neural computations of language and speech processes. Part Three focuses on an in-depth exploration of the neural processes associated with the main types of linguistic information ranging from phonemes and prosody to syntax, pragmatics and figurative language. Lastly, Part Five explores the phenomena that goes beyond the segments of basic linguistic units. In the Neuromethods series style, chapters include the kind of detail and key advice from the specialists needed to get successful results in your laboratory. Cutting edge and thorough *Language Electrified: Principles, Methods and Future Perspectives of Investigation* is a valuable resource that offers the necessary tool box for all researchers and scientists interested in the challenging field of the neurophysiology of language and speech.
