Screening for Biological Response Modifiers: Methods and Rationale James E. Talmadge, Isaiah J. Fidler, R.K. Oldham, 2012-12-06 The observation in the 1950s that nitrogen mustard and other toxic chemicals could induce antitumor responses in patients with refractory lymphoma initiated a massive search for active chemotherapeutic agents The initial observations stimulated a search for new chemotherapeutic agents which might have increased antitumor activity with less toxicity for normal tissues To aid in the search for these new chemicals and to attempt to distinguish among the many toxic chemicals which might be candidates for clinical studies the National Cancer Institute the pharmaceutical industry and the cancer research laboratories of most Western nations developed systems for screening drugs for antitumor activity Perhaps the most extensive screening program was established by the National Cancer Institute 1 This screening program has

evolved over the last two decades an evolution which has been repeatedly reviewed 2 5 Various screening programs in use have examined over 500 000 compounds as potential anticancer agents From these there are now approximately forty anticancer drugs in clinical use The utility of these compounds and their toxicities have been reviewed on many occasions It is now apparent that more active and less toxic anticancer drugs are needed It is also clear that the current screening programs are identifying compounds with similar levels of activity and with continuing moderate to severe toxicity 6

this book extends the research possibilities into numerous marine habitats Various approaches for extracting and applying the flora and fauna are discussed This book will be of value to researchers marine biotechnologists and medical practitioners due to the vast information as well as industrial and medical applications of marine substances all in one place

Structure-Activity Relationships of Anti-Tumour Agents D.N. Reinhoudt,T.A. Connors,H.M. Pinedo,K.W. van de Poll,2012-12-06 The Workshop series of the Koningin Wilhelmina Fonds is a feature of the interest of this Foundation to promote research and education in the field of cancer aiming to improve prognosis of the cancer patient For almost a century surgery has now been the main treatment modality for the cancer patient During the past 50 years radiation therapy has developed as a second important modality of treatment However neither of the two modalities are able to cure the majority of cancer patients as the disease is so often metastasized at presentation Cancer chemotherapy is a modality which does have the potential to cure patients with this advanced stage of disease In recent years the three modalities have been combined more and more and here is one of the reasons why the perspectives for the cancer patient have improved so much In addition certain types of cancers such as testicular carcinoma childhood tumors choriocarcinoma non Hodgkin lymphomas and others can now indeed often be cured by chemotherapy alone even if the disease is advanced The combination of drugs and the use of new drugs have greatly contributed to this development There are two main groups of new drugs analogs and new structures A great number of analogs of conventional structures have been developed during the past ten years A typical example of this group is adriamycin which is an analog of daunomycin
