atmospheric greenhouse gas concentrations by storing a large amount of carbon in biomass and soils The relative amount of above ground biomass allocated among different tree tissues is a functional indicator of forests health reflecting the material flow the wood quality and the plant survival strategy The way in which plants steer their photosynthetic product across their compartments is not fixed but likely vary over time across growth economies and among species and lastly is influenced by plant size and climate Obtaining a qualitative quantitative understanding of the influence that these factors have in both growth and biomass allocation is of fundamental importance either in understanding plant ecology and evolution and into developing environmental policies and useful forest management practices to cope with future climate change Fishery Bulletin ,1988

ECO-FRIENDLY BUILDING CONSTRUCTION FOR REDUCTION OF GLOBAL WARMING Nirajan Kumar Jha ,2024-11-26 Global warming is a significant global challenge with the construction industry playing a major role due to its high energy consumption and emissions The Intergovernmental Panel on Climate Change states that construction is responsible for about 40% of global energy use and 30% of annual greenhouse gas emissions The trend toward high rise and large scale construction driven by population growth exacerbates these impacts This underscores the need to examine how concrete cover thickness influences a building s life cycle as research on the environmental impact of reinforced concrete slabs is limited A recent study compared the CO emissions of three slab types ordinary reinforced concrete flat plate and voided slabs highlighting that voided slabs offer the greatest potential for reducing emissions Cement and steel with their high embodied energy significantly contribute to construction s environmental impact Shifting to sustainable slab systems could considerably lower CO emissions promoting eco friendly building practices *Transactions of the British Ceramic*

Miller,1972 **Imagining Industan** Zafar Adeel,Robert G. Wirsing,2016-10-20 This volume calls upon over a dozen Indus observers to imagine a scenario for the Indus basin in which transboundary cooperation over water resources overcomes the insecurity arising from water dependence and scarcity From diverse perspectives its essays examine the potential benefits to be gained from revisiting the 1960 Indus Waters Treaty as well as from mounting joint efforts to increase water supply to combat climate change to develop hydroelectric power and to improve water management The Indus basin is shared by four countries Afghanistan China India and Pakistan The basin s significance stems in part simply from the importance of these countries three of them among the planet s most populous states one of them boasting the world s second largest economy and three of them members of the exclusive nuclear weapons club However the basin s significance stems also from the great importance of the Indus waters themselves due especially to the region s massive dependence on irrigated agriculture as well as to the menace of climate change and advancing water scarcity The Industan this volume imagines is a definite departure from business as usual responses to the Indus basin s emerging fresh water crisis The objective is to kindle serious discussion of the cooperation needed to confront what many water experts believe is developing into one of the planet s most gravely threatened river basins It is thus both assessment of the current state of play in regard to water security in the Indus basin and recommendation about where to go from here
