EPCs Related to Preparatory Processes

All perceptual interactions between one's self and one's environment occur in the context of prior experience. There is always some degree of expectation based on what has occurred previously. One way to study the effects of expectation in a controlled manner is to deliberately manipulate preparatory activity by means of a get-ready cue. A clear example of the modulation of neural networks associated with preparatory processes is evident in the cued prestimulus interval of the skilled motor task described above. EPC patterns were computed in a 375 msec wide interval just prior to stimulus onset, after subjects had been cued to prepare to make the graded pressure response with the index finger of either the right or left hand (Gevins et al. 1987; 1989a). Figure 3 shows the EPC patterns in the preparatory interval for accurate right and left hand responses (A response was considered accurate when the response error was less than the mean error over the whole session comprising several hundred trials.) The "functional networks" for trials with subsequently accurate responses have covariances of the left prefrontal electrode with elec-

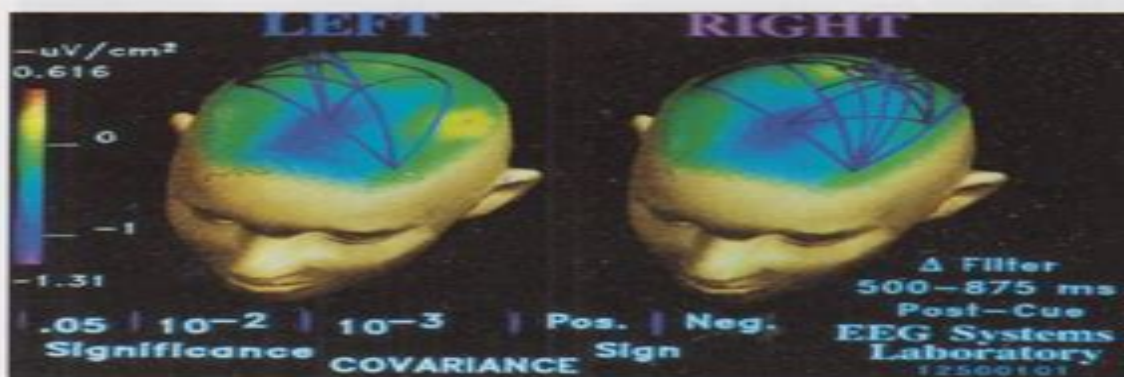

Fig. 3. Preparatory EPC patterns preceding accurate responses. EPC patterns were computed in an interval from 500 to 875 msec after seven subjects had been cued to prepare to make a response with the index finger of either the right or left hand. Data are shown only for those trials for which the response was subsequently accurate. The preparatory pattern preceding accurate responses has covariances of the left prefrontal electrode with electrodes overlying the same motor, somatosensory and parietal areas which were involved in actual response execution.

Temporal Coding in the Brain G. Buzsaki, R. Llinas, W. Singer, A. Berthoz, Y. Christen, 2012-12-06 Temporal coding in the brain documents a revolution now occurring in the neurosciences How does parallel processing of information bind together the complex nature of the outer and our inner worlds Do intrinsic oscillations and transient cooperative states of neurons represent the physiological basis of cognitive and motor functions of the brain Some answers to these challenging issues are provided in this book by leading world experts of brain function A common denominator of the works presented in this volume is the nature and mechanisms of neuronal cooperation in the temporal domain The topics range from simple organisms to the human brain The volume is intended for investigators and graduate students in neurophysiology cognitive neuroscience neural computation and neurology
