Spillover and Mobility of Species on Solid Surfaces A. Guerrero-Ruiz, I. Rodriguez-Ramos, 2001-08-02 Spillover and Mobility of Species and Solid Surfaces collects the papers which were presented at the Fifth International Conference Spillover either as oral or poster contributions as well as the summaries of the invited lectures This congress and its publication in the Studies on Surface Science and Catalysis series follow the tradition of previous conferences on spillover initiated in Lyon 1983 and continued in Leipzig 1989 Kyoto 1993 and Dalian 1997 For the fifth conference held in S L el Escorial Madrid the organising committee has attempted to compile representative contributions which illustrate the advances in understanding the spillover phenomenon since 1997 Spillover is a process taking place during the interface of gas reactant molecules mainly hydrogen and oxygen on solid surfaces However different contributions to the more general area of the chemistry at surfaces related with the mobility and migration of species diffusion through membranes fuel cell catalysts etc have also been included In fact the title of the present volume summarizes this attempt to extend the conference topics towards dynamics at surfaces Among the 70 contributions received the 56 accepted papers were selected on the basis of the reports of at least two international reviewers according to standards comparable to those applied for other specialised journals These papers are from 21 different countries

Coal and Coal-Related Compounds Toshiaki Kabe, Atsushi Ishihara, Eika Weihua Qian, I. Putu Sutrisna, Yaeko Kabe, 2004-11-18 Coal is more abundant than petroleum and natural gas Further coal is not localized but can be used by many more countries than petroleum Therefore if we can establish coal utilization technology coal will bring about a great contribution to human life and society On the other hand shortage of petroleum and natural gas are anticipated in the second half of the 21st century To compensate the use of coal is expected to gradually increase during the 21st century In the future the development of the coal utilization technology will become more and more important to insure the supply of liquid fuels for transportation and carbon sources for the manufacture of chemicals and plastic materials In order to develop such technologies the elucidation of the structure of coal is a fundamental area of study Further more efficient coal utilization technology must be established to meet environmental legislation One of the key technologies for this purpose is catalysis This volume provides detail of the basic and practical aspects of the science and technology of coal utilization with and without catalysts The actual structure of coal the chemistry included in the reactivity of coal the methods to elucidate the structure of coal and reaction mechanisms of coal conversion the most important catalyst for converting coal to liquid and gas the role of the catalysts in coal conversion the problems in the process engineering and how to meet environmental regulations are discussed in detail The recent progress in studies on the structure and reactivity of coal made over the last century is summarized and reviewed with emphasis on both fundamental and applied aspects of the science and technology for coal processing in the presence and absence of catalysts This book highlights the issues faced in trying to discover more efficient coal utilization technology Provides detailed discussion on how to meet environmental regulations and legislation Fills the gap between both the scientific and practical sides of coal utilization with and without catalysts

21st Century M. Mercedes Maroto-Valer, Chunshan Song, Yee Soong, 2002-08-31 As we are moving ahead into the 21st century our hunger for cost effective and environmentally friendly energy continues to grow The Energy Information Administration of US has forecasted that only in the first two decades of the 21st century our energy demand will increase by 60% compared to the levels at the end of the 20th century Fossil fuels have been traditionally the major primary energy sources worldwide and their role is expected to continue growing for the forecasted period due to their inherent cost competitiveness compared to non fossil fuel energy sources However the current fossil energy scenario is undergoing significant transformations especially to accommodate increasingly stringent environmental challenges of contaminants like sulfur dioxide nitrogen oxides or mercury while still providing affordable energy Furthermore traditional fossil fuel utilization is inherently plagued with greenhouse gas emissions from combustion especially carbon dioxide from stationary sources as well as from mobile sources Should worldwide government policies dictate a reduction of greenhouse gas emissions such as proposed by the Kyoto Protocol and the implementation of carbon taxes fossil fuels would lose their significant competitive appeal in favor of nuclear energy and renewable energy sources However the current non fossil fuel energy share of the worldwide energy market is merely below 15% and therefore it is more likely that fossil fuel energy producers would adapt to the new requirements by developing and implementing emission control technologies and emission trades among other strategies *Catalyst Deactivation 2001* J.J.
