**Design and Construction Issues at Hazardous Waste Sites ,1991      Recycling of Used Lead-Acid Batteries** Katherine von Stackelberg,Pamela R. D. Williams,Ernesto Sánchez-Triana,Santiago Enriquez,2022-06-30 This document includes a pragmatic framework for designing representative studies and developing uniform sampling guidelines to support estimates of morbidity that are explicitly linked to exposure to land based contaminants from used lead acid battery recycling ULAB activities A primary goal is to support environmental burden of disease evaluations which attempt to attribute health outcomes to specific sources of pollution The guidelines provide recommendations on the most appropriate and cost effective sampling and analysis methods to ensure the collection of representative population level data sample size recommendations for each contaminant and environmental media biological sampling data household survey data and health outcome data These guidelines focus on small scale ULABs that are known to generate significant amounts of lead waste through the smelting process as well as other metals including arsenic and cadmium A primary concern with lead exposure is the documented association with neurodevelopmental outcomes in children as demonstrated by statistically significant reduced performance on a variety of cognitive tests These associations are evident even in the youngest children and toxicological and epidemiologic data indicate these effects have no threshold Other potential exposures include arsenic and cadmium and exposure to these contaminants is also associated with neurodevelopmental outcomes in children as well as arsenicosis bladder lung and skin cancers and renal outcomes The primary objective of this document is to guide research to assess the relationship between environmental contamination exposures and health outcomes related to a subset of contaminants originating from ULAB activities for particularly vulnerable populations such as children and the general population within a single household in the vicinity of ULAB sites in low and middle income countries To achieve this objective biomonitoring and health outcome data are linked to household survey and environmental data for example soil dust water and agricultural products at the individual level from an exposed population compared to individuals from an unexposed reference population Data on exposures and health outcomes in the same individual across a representative set of individuals is required to support an understanding of the potential impact of ULAB activities on local populations The guidelines can also assist in building local capacity to conduct environmental assessments following a consistent methodology to facilitate comparability across ULAB sites in different geographic areas Sampling strategies and methods are prioritized given information needs resource availability and other constraints or considerations The document includes a number of supporting appendixes that provide additional resources and references on relevant topics Data obtained following these recommendations can be used to support consistent comparable and standardized community risk and health impact assessments at contaminated sites in low and middle income countries These data can also be used to support economic analyses and risk management decision making for evaluating site cleanup and risk mitigation options in the most cost

effective and efficient manner Following these recommendations will facilitate comparisons and meta analyses across studies by standardizing data collection efforts at the community level *Groundwater Remediation* Nicholas P.

Cheremisinoff,2017-06-13 Written by one of the world s foremost authorities on the subject this is the most comprehensive and in depth treatment available to environmental engineers and scientists for the remediation of groundwater one of the earth s most precious resources Groundwater is one of the Earth s most precious resources We use it for drinking bathing and many other purposes Without clean water humans would cease to exist Unfortunately because of ignorance or lack of caring groundwater is often contaminated through industrialization construction or any number of other ways It is the job of the environmental engineer to remediate the contaminated groundwater and make what has been tainted safe again Selecting the proper remediation strategy and process is the key to moving forward and once this process has been selected it must be executed properly taking into consideration the costs the type of contaminants that are involved time frames and many other factors This volume provides a broad overview of the current and most widely applied remedial strategies Instead of discussing these strategies in a generic way the volume is organized by focusing on major contaminants that are of prime focus to industry and municipal water suppliers The specific technologies that are applicable to the chemical contaminants discussed in different chapters are presented but then cross referenced to other chemical classes or contaminants that are also candidates for the technologies The reader will also find extensive cost guidance in this volume to assist in developing preliminary cost estimates for capital equipment and operations maintenance costs which should be useful in screening strategies The eight chapters cover all of the major various types of contaminants and their industrial applications providing a valuable context to each scenario of contamination This is the most thorough and up to date volume available on this important subject and it is a must have for any environmental engineer or scientist working in groundwater remediation
