Cacuci, 2003-05-28 As computer assisted modeling and analysis of physical processes have continued to grow and diversify sensitivity and uncertainty analyses have become indispensable investigative scientific tools in their own right While most techniques used for these analyses are well documented there has yet to appear a systematic treatment of the method based on adjoint operators which is applicable to a much wider variety of problems than methods traditionally used in control theory This book fills that gap focusing on the mathematical underpinnings of the Adjoint Sensitivity Analysis Procedure ASAP and the use of deterministically obtained sensitivities for subsequent uncertainty analysis **Topology Optimization Theory for Laminar Flow** Yongbo Deng, Yihui Wu, Zhenyu Liu, 2017-09-27 This book presents the topology optimization theory for laminar flows with low and moderate Reynolds numbers based on the density method and level set method respectively The density method based theory offers efficient convergence while the level set method based theory can provide an accurate mathematical expression of the structural boundary Unsteady body force driven and two phase properties are basic

characteristics of the laminar flows The book discusses these properties which are typical of microfluidics and one of the research hotspots in the area of Micro Electro Mechanical Systems MEMS providing an efficient inverse design approach for microfluidic structures To demonstrate the applications of this topology optimization theory in the context of microfluidics it also investigates inverse design for the micromixer microvalve and micropump which are key elements in lab on chip devices

Regularization of Ill-Posed Problems by Iteration Methods S.F. Gilyazov, N.L. Gol'dman, 2013-04-17 Iteration regularization i.e. utilization of iteration methods of any form for the stable approximate solution of ill posed problems is one of the most important but still insufficiently developed topics of the new theory of ill posed problems In this monograph a general approach to the justification of iteration regularization algorithms is developed which allows us to consider linear and nonlinear methods from unified positions Regularization algorithms are the classical iterative methods steepest descent methods conjugate direction methods gradient projection methods etc complemented by the stopping rule depending on level of errors in input data They are investigated for solving linear and nonlinear operator equations in Hilbert spaces Great attention is given to the choice of iteration index as the regularization parameter and to estimates of errors of approximate solutions Stabilizing properties such as smoothness and shape constraints imposed on the solution are used On the basis of these investigations we propose and establish efficient regularization algorithms for stable numerical solution of a wide class of ill posed problems In particular descriptive regularization algorithms utilizing a priori information about the qualitative behavior of the sought solution and ensuring a substantial saving in computational costs are considered for model and applied problems in nonlinear thermophysics The results of calculations for important applications in various technical fields a continuous casting the treatment of materials and perfection of heat protective systems using laser and composite technologies are given **Nonlinear Functional Analysis and Its Applications, Part 2** Felix E. Browder, 1986
