Summer Of Speed:

The Analysis of Directional Time Series: Applications to Wind Speed and Direction Jens Breckling, 2012-12-06 Given a series of wind speeds and directions from the port of Fremantle the aim of this monograph is to detect general weather patterns and seasonal characteristics To separate the daily land and sea breeze cycle and other short term disturbances from the general wind the series is divided into a daily and a longer term synoptic component The latter is related to the atmospheric pressure field while the former is studied in order i to isolate particular short term events such as calms storms and oscillating winds and ii to determine the land and sea breeze cycle which dominates the weather pattern for most of the year All these patterns are described in detail and are related to the synoptic component of the data Two time series models for directional data and a new measure of angular association are introduced to provide the basis for certain parts of the analysis

Summer Climate at Selected Sites on the Ross Ice Shelf and the Greenland Ice Sheet Michael A. Bilello, Roy E. Bates, 1975 Climatic summaries for several sites on the Ross Ice Shelf Antarctica and selected locations on the Greenland ice sheet were analyzed to determine the type of weather that can be expected in these areas during the summer months Daily minimum and maximum air temperatures of from 0 to 25F are estimated to occur near 82 5 degrees S and 166 degrees W during December January and February on the Ross Ice Shelf Snowfall in summer is relatively infrequent and total amounts generally light so that extended periods of good flying weather can be expected in summer However intervals of poor weather including heavy snow fog whiteout and strong winds with drifting and blowing snow can occur each summer Average minimum and maximum air temperatures during June July and August range from 8F to above freezing in the southern portion of the Greenland ice sheet and from 9 to 17F near the summit Stations east of the crest record light winds from the north and northeast and those west of the crest stronger winds from the east Winds near South Site at 63 degrees N in mid summer are predicted to be generally westerly and to average 9 to 10 mph Snowfall and fog also apparently occur more frequently in the southern region of the ice sheet Although good flying weather can be expected during much of the summer near the summit intervals of snow fog whiteout or strong winds with drifting or blowing snow can occur
