Gaastra, 2012-12-06 The last few years have seen the rapid development of new methodology in the field of molecular biology. New techniques have been regularly introduced and the sensitivity of older techniques greatly improved upon. Developments in the field of genetic engineering in particular have contributed a wide range of new techniques. The purpose of this book therefore is to introduce the reader to a selection of the more advanced analytical and preparative techniques which the editors consider to be frequently used by research workers in the field of molecular biology. In choosing techniques for this book we have obviously had to be selective and for the sake of brevity a knowledge of certain basic biochemical techniques and terminology has been assumed. However, since many areas of molecular biology are developing at a formidable rate and constantly generating new terminology, a glossary of terms has been included. The techniques chosen for this book are essentially based on those used in a series of workshops on techniques in molecular biology that have been held at The Hatfield Polytechnic in recent years. In choosing these chapters we have taken into account many useful suggestions and observations made by participants at these workshops. Each chapter aims to describe both the theory and relevant practical details for a given technique and to identify both the potential and limitations of the technique. Each chapter is written by authors who regularly use the technique in their own laboratories. *Methods in Cell Biology*, 1974-03-11 *Methods in Cell Biology*

Subcellular Components G. D. Birnie, 2014-05-20 *Subcellular Components: Preparation and Fractionation* talks about cells and particles components including their preparation and fractionation. The book includes theories and answers to questions that are relevant to the study. The first chapter of the book details various facts about homogenization of mammalian cells. This chapter presents the results of studies on solid tissues and single cell suspensions; the author then offers his conclusion of the study. The next two chapters highlight the methods on isolating nuclei, including the guides for standard assessment and the procedure of isolation along with analysis of nuclei biochemical properties. The main topics in Chapter 4 are mitochondria from animal tissues and yeasts; this chapter also discusses the preparation for a rat liver, blowfly flight muscle, yeast, and brain mitochondria. The chapter that follows widely talks about lysosomes, including its historical background, centrifugal method, and related topics. In the next several chapters, the topics covered include purification, isolation, preparation, and separation of cells, including plasma membrane, polysomes, ribosomes, microsomes, and microvilli. The book serves as a great reference for undergraduates and postgraduates in the field as it contains a thorough discussion of various relevant studies. **Biochemical Methods** S.
