

- The Sulfhydryl Group
- Sulfur is found mainly in proteins in the form of sulfhydryl groups or disulfide groups.
- Like oxygen, sulfur typically has a valence of 2, although it can also have a valence of 6, as in sulfuric acid.
- Sulfur is found in certain amino acids and proteins in the form of sulfhydryl groups (symbolized as -SH). Two sulfhydryl groups can interact to form a disulfide group (symbolized as -S-S-).
- By convention, sulfur atoms are represented by yellow spheres in molecular models.
- The figure above illustrates two molecules: one with a sulfhydryl group and one with a disulfide group.

## **Sulfur In Proteins:**

**Sulfur in Proteins** Reinhold Benesch, 2012-12-02 Sulfur in Proteins is a collection of papers presented at the 1958 Symposium on Sulfur in Proteins held in Falmouth Massachusetts The symposium primary aims to explore the varied and unusual roles of S S and SH groups in proteins This book is organized into eight chapters that cover a wide variety of proteins including serum iron copper and muscle proteins as well as enzymes and viruses The opening chapter describes the various protein reactions involving sulfur emphasizing the chemical modification of thiol and disulfide groups Considerable chapters are devoted to the chemical properties biogenesis reactivity and oxygenation of specific proteins A chapter highlights some aspects of protein structure in relation to the role of S S and SH groups in enzymic catalysis This chapter also describes the properties of sulfhydryl groups in yeast alcohol dehydrogenase The final chapters examine the role of sulfur groups in several virus proteins and in cell division This work will be of great value to protein scientists and researchers

**Iron-Sulfur Clusters in Chemistry and Biology** Tracey Rouault, 2014-08-20 This volume on iron sulfur proteins includes chapters that describe the initial discovery of iron sulfur proteins in the 1960s to elucidation of the roles of iron sulfur clusters as prosthetic groups of enzymes such as the citric acid cycle enzyme aconitase and numerous other proteins ranging from nitrogenase to DNA repair proteins The capacity of iron sulfur clusters to accept and delocalize single electrons is explained by basic chemical principles which illustrate why iron sulfur proteins are uniquely suitable for electron transport and other activities Techniques used for detection and stabilization of iron sulfur clusters including EPR and Mossbauer spectroscopies are discussed because they are important for characterizing unrecognized and elusive iron sulfur proteins Recent insights into how nitrogenase works have arisen from multiple advances described here including studies of high resolution crystal structures Numerous chapters discuss how microbes plants and animals synthesize these complex prosthetic groups and why it is important to understand the chemistry and biogenesis of iron sulfur proteins In addition to their vital importance in mitochondrial respiration numerous iron sulfur proteins are important in maintenance of DNA integrity Multiple rare human diseases with different clinical presentations are caused by mutations of genes in the iron sulfur cluster biogenesis pathway Understanding iron sulfur proteins is important for understanding a rapidly expanding group of metabolic pathways important in all kingdoms of life and for understanding processes ranging from nitrogen fixation to human disease

**Trends in Human Hair Growth and Alopecia Research** Dominique van Neste,J.M. Lachapelle,J.L. Antoine,2012-12-06 It is now thirty years since William Montagna and Richard Ellis edited The Biology of Hair Growth In his

introduction Stephen Rothman of the University of Chicago USA and one of the driving forces behind research on skin at the time wrote The pilary system is a perfect microcosmic structure In this microcosmos we find birth development ageing and death activity and rest color formation and decolorification greasiness and dryness infection and sterilization hypertrophy and atrophy Benign tumours and malignant ones He foresaw the human pilary system as a model for the study of a multitude of human diseases including ageing and cancer It was not however until the seventies that the development of micro biochemical techniques indeed allowed the use of the human hair follicle as a convenient biopsy tissue for Biomedical Research in general Measurement of enzyme activities and important cofactors and culturing of cells from single follicles all became possible In the eighties dermal papilla cells were grown in culture and this opened the way to study hair differentiation in vitro Studying hair differentiation is in fact studying growth regulation and it is this aspect that by far transcends the importance of studying hair growth itself Let us not forget that metastatic prostate cancer is treated with the same drug cyproterone acetate that is used for the treatment of alopecia and hirsutism in women
