Wakefield, 1928 **Sedimentology and Provenance of the Early Proterozoic Michigamme Formation and Goodrich Quartzite, Northern Michigan** Richard W. Ojakangas, 1994 The Early Proterozoic Michigamme Formation of northern Michigan was deposited in the southeastern part of the Animikie basin The formation conformably overlies the Goodrich Quartzite and comprises three widespread members a lower member of thin bedded shale siltstone and sandstone the Bijiki Iron formation Member and an upper member of turbiditic graywacke siltstone and mudstone and a few local members The Goodrich Quartzite is interpreted as having been deposited in a tidally influenced shallow marine environment The lower member of the Michigamme is interpreted as having been deposited in a tidally influenced environment the iron formation member as having been deposited below wave base in somewhat deeper water and the upper member as having been deposited in still deeper water with turbidity currents being a major depositional mechanism Several lines of evidence including paleocurrents paleogeographic setting and neodymium isotopes suggest that the graywacke of the southern part of the outcrop area was derived from the south Early Proterozoic Wisconsin magmatic terranes Archean miniplates and older Early Proterozoic sedimentary units formed on the continental margin and that the graywacke in the northern area was derived from an Archean terrane to the north The tectonic model that best fits the available data is a northward migrating foreland basin **U.S. Geological Survey Bulletin**, 1983 Bulletin Tennessee. Palin, Di Li, Jiyuan Yin, Peng Wang, 2023-10-31 Convergent plate margins are important places for material and energy recycling of the Earth in particular major sites for continental growth reworking and recycling They exhibit as narrow belt structure in the rigid outer layer of the Earth corresponding to subduction zones at lithospheric mantle depths and orogenic belts at crustal depths The type geometry and thermal structure of subduction zones have critical impacts on subduction processes and nature of products resulting in a variety of magmatic rocks and ore deposits at convergent margins Identification and

classification of the physical structure and chemical variation at convergent margins as well as confirming their correlation with specific subduction types and stages are of pivotality to understand the spatiotemporal interaction between asthenosphere and lithosphere in orogenic belts For places where magmatic arcs get partially or entirely destroyed by surface and or subduction erosion adjacent sedimentary rocks are ideal geological records for paleotectonic reconstruction

A Method of Obtaining Climatic Parameters from Leaf Assemblages Jack A. Wolfe,1993 Protist Diversity and Geographical Distribution W. Foissner,David Leslie Hawksworth,2009-07-24 Conservation and biodiversity of protists The conservation of biodiversity is not just an issue of plants and vertebrates It is the scarcely visible invertebrates and myriads of other microscopic organisms that are crucial to the maintenance of ecological processes on which all larger organisms and the composition of the atmosphere ultimately depend Biodiversity and Conservation endeavours to take an holistic view of biodiversity and when the opportunity arises to issue collections of papers dealing with too often neglected groups of organisms The protists essentially eukaryotes that cannot be classified in the kingdoms of animals fungi or plants include some of the least known groups of organisms on earth They are generally treated as a separate kingdom commonly named Protista or Protoctista in textbooks but in reality they are a mixture of organisms with disparate attributes Some authors have hypothesized that the numbers of protists are not especially large and that many have extraordinarily wide distributions However the picture that unfolds from the latest studies discussed in this issue is different There are many species with wide ranges and proportionately more cosmopolitan species than in macroorganism groups as a result of their long evolutionary histories but there are also definite patterns and geographical restrictions to be found Further some protists are linked to host organisms as mutualists or parasites and necessarily confined to the distributions of their hosts **U.S. Geological Survey Bulletin** Paul Kibler Sims,Richard W. Ojakangas,S. A. Nachatilo,S. R. Hemming,Theodore J. Bornhorst,Val W. Chandler,William J. Gregg,G. B. Morey,Gilbert N. Hanson,R. L. Bauer,Rodney C. Johnson,Warren C. Day,Scott M. margin and that the graywacke in the northern area was derived from an Archean terrane to the north The tectonic model that best fits the available data is a northward migrating foreland basin **Intergroup Relations** Michael A.
