systems Moreover in order for SEMS to act expediently in a changing and unfamiliar environment and without human participation it is necessary to endow them with properties similar to the mental properties of animals since emotions and temperament are among the main assessments of the behavior of highly organized organisms Therefore it is quite natural to take into account the influence of emotions on decision making in conditions of incomplete information about the environment especially when SEMS interacts with a person to perform complex technological operations Despite the existing technical difficulties a significant number of mathematical and software tools have accumulated to date providing the CNS SEMS with the ability to take into account the psyche when interacting with a person Limitations of sensory capabilities and computing power should be attributed to the limited cognitive abilities of artificial intelligence These features of the central nervous system of modern SEMS must be taken into account when creating mathematical and software tools for SEMS information and measurement systems for the formation of databases and knowledge for recognition and classification decision making and the formation of control actions
