Product Research N. R. Srinivasa Raghavan, John A. Cafeo, 2010-03-11 7 1 1 Background Uncertainty can be considered as the lack of adequate information to make a decision It is important to quantify uncertainties in mathematical models used for design and optimization of nondeterministic engineering systems In general certainty can be broadly classified into three types Bae et al 2004 Ha Rok 2004 Klir and Wierman 1998 Oberkamp and Helton 2002 Sentz 2002 The first one is aleatory uncertainty also referred to as stochastic uncertainty or inherent certainty it results from the fact that a system can behave in random ways For example the failure of an engine can be modeled as an aleatory uncertainty because the failure can occur at a random time One cannot predict exactly when the engine will fail even if a large quantity of failure data is gathered available The second one is epistemic uncertainty also known as subjective uncertainty or reducible certainty it is the uncertainty of the outcome of some random event due to lack of knowledge or information in any phase or activity of the modeling process By gaining information about the system or environmental factors one can reduce the epistemic uncertainty For example a lack of experimental data to characterize new materials and processes leads to epistemic uncertainty
