Computer-aided Software Engineering Thomas J.

Bergin,1993-01-01 The successful implementation of CASE technology requires a long term and comprehensive commitment to the pursuit of raising the quality of software design and ultimately improving the information management within the organization. *Computer Aided Software Engineering Issues and Trends for the 1990s and Beyond* covers all aspects of preparing an organization for the successful implementation of a CASE program. Actual case studies, empirical research and theoretical suppositions are used to assess how CASE is being used today and to predict future directions.

Software Development Environments and CASE Technology Albert Endres, Herbert Weber, 1991. Software development environments are integrated sets of tools, techniques and processes that assist in the systematic development of software products. They are intended to support all phases of the software development cycle: requirements definition, design, implementation, test and maintenance. These Computer Aided Software Engineering CASE tools typically make use of graphic manipulation facilities and rely on some form of development database to exchange various types of design objects between tools. Facilitated by the availability of powerful workstations, implementations of these technologies are now within reach of every software developer. This volume presents the proceedings of a symposium organized by the GI Gesellschaft f r Informatik, the GMD Gesellschaft f r Mathematik und Datenverarbeitung and ESEC European Software Engineering Conferences. The symposium brought together application development managers and top specialists involved in the selection and introduction of software development tools, leading developers of such tools and well known authorities from the research community. The proceedings contain first hand information on practical experiences and requirements, development directions and strategies and key research issues and results.

Data Distribution Richard Wiliams, 2018-12-17

Published in 1992, *Business information* has evolved from typewriter card index, decentralized through the era of DP Department and mainframe, centralized to present mix with PCs and networks distributed. This book demonstrates how data distribution can function in the best interests of organizations through a managed environment. It looks at what is needed from the systems professionals to support current methods, reporting actual experience, defining techniques and examining the opportunities.

The Impact Of Case Technology On Software Processes Daniel E Cooke,1994-03-07 This review volume consists of articles concerning CASE technology and research as discussed from two perspectives For the most part the available CASE technology is intended to automate certain phases of the software development life cycle The book contains articles which focus on how the current technology alters the nature of software engineering efforts Papers which delve into the knowledge a software engineer needs to possess and how the software engineer s work content has or may change are included Cultural as well as technical considerations are discussed The current CASE technology exists to automate phases of the software development life cycle thus affecting software development in the short term but we cannot ignore the CASE research efforts toward a higher generation language Such a language should affect software development in the long term Papers suggesting how these languages may alter the nature of software engineering in the future are presented

Software Maintenance - A Management Perspective Phaneendra Nath Vellanky,2007-10-23 Computer systems play an important role in our society Software drives those systems Massive investments of time and resources are made in developing and implementing these systems Maintenance is inevitable It is hard and costly Considerable resources are required to keep the systems active and dependable We cannot maintain software unless maintainability characters are built into the products and processes There is an urgent need to reinforce software development practices based on quality and reliability principles Though maintenance is a mini development lifecycle it has its own problems Maintenance issues need corresponding tools and techniques to address them Software professionals are key players in maintenance While development is an art and science maintenance is a craft We need to develop maintenance personnel to master this craft Technology impact is very high in systems world today We can no longer conduct business in the way we did before That calls for reengineering systems and software Even reengineered software needs maintenance soon after its implementation We have to take business knowledge procedures and data into the newly reengineered world Software maintenance people can play an important role in this migration process Software technology is moving into global and distributed networking environments Client server systems and object orientation are on their way Massively parallel processing systems and networking resources are changing database services into corporate data warehouses Software engineering environments rapid application development tools are changing the way we used to develop and maintain software Software maintenance

is moving from code maintenance to design maintenance even onto specification maintenance Modifications today are made at specification level regenerating the software components testing and integrating them with the system Eventually software maintenance has to manage the evolution and evolutionary characteristics of software systems Software professionals have to maintain not only the software but the momentum of change in systems and software In this study we observe various issues tools and techniques and the emerging trends in software technology with particular reference to maintenance We are not searching for specific solutions We are identifying issues and finding ways to manage them live with them and control their negative impact
