Several large, dark, spherical water droplets are scattered across the surface, illustrating the concept of water repellency. The droplets are in sharp focus, while the background is slightly blurred.

Soil Water Repellency Origin Consequences And Amelioration:

Soil Water Repellency C.J. Ritsema, L.W. Dekker, 2012-12-02 It has become clear that soil water repellency is much more wide spread than formerly thought Water repellency has been reported in most continents of the world for varying land uses and climatic conditions Soil water repellency often leads to severe runoff and erosion rapid leaching of surface applied agrichemicals and losses of water and nutrient availability for crops At present no optimum management strategies exist for water repellent soils focusing on minimizing environmental risks while maintaining crop production The book starts with a historical overview of water repellency research followed by seven thematic sections covering 26 research chapters The first section discusses the origin the second the assessment and the third the occurrence and hydrological implications of soil water repellency The fourth section is devoted to the effect of fire on water repellency section five deals with the physics and modeling of flow and transport in water repellent soils section six presents amelioration techniques and farming strategies to combat soil water repellency and section seven concludes the book with an extensive bibliography on soil water repellency

Selected Water Resources Abstracts, 1990-10 Plant Micronutrients Tariq Aftab, Khalid Rehman Hakeem, 2020-08-04 Plants require essential nutrients macronutrients and micronutrients for normal functioning Sufficiency range is the levels of nutrients necessary to meet the plant's needs for optimal growth This range depends on individual plant species and the particular nutrient Nutrient levels outside of a plant's sufficiency range cause overall crop growth and health to decline due either to deficiency or toxicity from over accumulation Apart from micronutrients B Cl Mn Fe Zn Cu and Mo Aluminum Al cerium Ce cobalt Co iodine I lanthanum La sodium Na selenium Se silicon Si titanium Ti and vanadium V are emerging as

novel biostimulants that may enhance crop productivity and nutritional quality These beneficial elements are not essential but when supplied at low dosages they augment plant growth development and yield by stimulating specific molecular biochemical and physiological pathways in responses to challenging environments The book is the first reference volume that approaches plant micronutrient management with the latest biotechnological and omics tools Expertly curated chapters highlight working solutions as well as open problems and future challenges in plant micronutrient deficiency or toxicity We believe this book will introduce readers to state of the art developments and research trends in this field Australian Journal of Soil Research ,2005

Maize Improvement Shabir Hussain Wani,Zahoor Ahmad Dar,Gyanendra Pratap Singh,2023-03-10 Maize is one of the most generally grown cereal crops at global level followed by wheat and rice Maize is the major crop in China both in terms of yield and acreage In 2012 worldwide maize production was about 840 million tons Maize has long been a staple food of most of the global population particularly in South America and Africa and a key nutrient resource for animal feed and for food industrial materials Maize belts vary from the latitude 58 north to the latitude 40 south and maize ripens every month of the year Abiotic and biotic stresses are common in maize belts worldwide Abiotic stresses chiefly drought salinity and extreme temperatures together with biotic stresses primarily fungi viruses and pests negatively affect maize growth development production and productivity In the recent past intense droughts waterlogging and extreme temperatures have relentlessly affected maize growth and yield In China 60% of the maize planting area is prone to drought and the resultant yield loss is 20% 30% per year in India 25% 30% of the maize yield is lost as a result of waterlogging each year The biotic stresses on maize are chiefly pathogens fungal bacterial and viral and the consequential syndromes like ear stalk rot rough dwarf disease and northern leaf blight are widespread and result in grave damage

Roughly 10% of the global maize yield is lost each year as a result of biotic stresses. For example, the European corn borer *ECB Ostrinia nubilalis* H. borer causes yield losses of up to 2000 million dollars annually in the USA alone. In the northern regions of China, the maize yield loss reaches 50% during years when maize is badly affected by northern leaf blight. In addition, abiotic and biotic stresses, time and again, are present at the same time and rigorously influence maize production. To fulfill requirements of each maize growing situation and to tackle the above-mentioned stresses in an effective way, sensibly designed multidisciplinary strategies for developing suitable varieties for each of these stresses have been attempted during the last decade. Genomics is a field of supreme significance for elucidating the genetic architecture of complex quantitative traits and characterizing germplasm collections to achieve precise and specific manipulation of desirable alleles. Advances in genotyping technologies and high-throughput phenomics approaches have resulted in accelerated crop improvement, like genomic selection and speed breeding, particularly in maize. Molecular breeding tools like collaborating all omics have led to the development of maize genotypes having higher yields, improved quality, and resilience to biotic and abiotic stresses. Through this book, we bring into one volume the various important aspects of maize improvement and the recent technological advances in development of maize genotypes with high yield, high quality, and resilience to biotic and abiotic stresses.

Nutrient Use Efficiency: from Basics to Advances Amitava Rakshit, Harikesh Bahadur Singh, Avijit Sen, 2014-12-26. This book addresses in detail multifaceted approaches to boosting nutrient use efficiency (NUE) that are modified by plant interactions with environmental variables and combine physiological, microbial, biotechnological, and agronomic aspects. Conveying an in-depth understanding of the topic will spark the development of new cultivars and strains to induce NUE coupled with best management practices that will immensely benefit agricultural systems, safeguarding their soil, water, and air quality. Written by recognized experts in the field, the book is intended to provide students, scientists, and policymakers with essential insights into holistic approaches to NUE, as well as an overview of some successful case studies. In the present understanding of agriculture, NUE represents a question of process optimization in response to the increasing fragility of our natural resources base and threats to food grain security across the globe. Further improving nutrient use efficiency is a prerequisite to reducing production costs, expanding crop acreage into non-competitive marginal lands with low nutrient resources, and preventing environmental contamination. The nutrients most commonly limiting plant growth are N, P, K, S, and micronutrients like Fe, Zn, B, and Mo. NUE depends on the ability to efficiently take up the nutrient from the soil but also on transport, storage, mobilization, usage within the plant, and the environment. A number of approaches can help us to understand NUE as a whole. One involves adopting best crop management practices that take into account root-induced rhizosphere processes, which play a pivotal role in controlling nutrient dynamics in the soil-plant-atmosphere continuum. New technologies, from basic tools like leaf color charts to sophisticated sensor-based systems and laser land leveling, can reduce the dependency on laboratory assistance and manual labor. Another approach concerns the development of crop plants

through genetic manipulations that allow them to take up and assimilate nutrients more efficiently as well as identifying processes of plant responses to nutrient deficiency stress and exploring natural genetic variation Though only recently introduced the ability of microbial inoculants to induce NUE is gaining in importance as the loss immobilization release and availability of nutrients are mediated by soil microbial processes
